28     **
29     ** Name:(S) pWARN - Warning poll
30     **
31     ** Category: POLL
32     **
33     ** Type: POLL
34     **
35     ** Purpose:
36     ** Alert LEX files that a warning is about to go out.
37     **
38     ** Should poll be "Handled" (return with XM=0)?:
39     ** Only if you want the message to be entirely suppressed.
40     ** Most applications will "handle" the poll without
41     ** setting XM=0 (see below).
42     **
43     ** Meaning of "Handling" Poll (what does code do if XM=0?):
44     ** It's up to you. For instance, a LEX file might want to
45     ** intercept all warnings and errors to write them to a
46     ** file; in this case, do your thing and return with XM=0
47     ** so that the message is suppressed.
48     **
49     ** Entry conditions for handler (registers, ST, RAM, etc.):
50     ** B[A] = Poll number.
51     ** HEX mode.
52     ** P=0.
53     ** A(R)=0 if Quiet (flag -1) is to be checked,
54     ** else A(R)=FFFFF if Quiet is not to be checked.
55     **

```

```

56      **      F E D C B A 9 8 7 6 5 4 3 2 1 0
57      **      RO: | | | | | | | | | | | | | |
58      **      ^   ^   ^   ^   ^   ^   ^   ^
59      **      |   |   |   |   |   |   |   |
60      **      |   |   |   |   |   |   |   |
61      **      | control codes for text insertion |
62      **      + Entry P value (see MFWRN)         |
63      **      LEX ID of message                   |
64      **      message number                       |
65      **
66      ** Normal exit conditions from handler if handled (ST, RAM,
67      ** registers, etc.):
68      **      Carry clear.
69      **      HEX mode.
70      **      XM=0.
71      **      P=0.
72      **      no other requirements -- the message will be suppressed
73      **
74      ** Normal exit conditions from handler if not handled (ST, RAM,
75      ** registers, etc.):
76      **      Carry clear.
77      **      HEX mode.
78      **      XM=1.
79      **      P=0.
80      **      RO can be changed as needed to adjust msg (see MFWRN)
81      **
82      ** Error exit conditions from handler:
83      **      Carry set.
84      **      HEX mode.
85      **      C[0-3] = Error number.
86      **      P= value to select options in MFERR*
87      **
88      ** Available subroutine levels:
89      **      6
90      **
91      ** What registers/RAM may be used if handled?:
92      **      A,B,C,D,DO,D1,P,RO
93      **      (Not available: R1,R2,R3,R4,ST, scratch RAM)
94      **
95      ** What registers/RAM may be used if not handled?:
96      **      A,B,C,D,DO,D1,P,RO (change RO only to affect msg)
97      **      (Not available: R1,R3,R4,ST, scratch RAM.
98      **      R2 unavailable except for rare cases when insertion
99      **      text is being passed to the msg routines.)
100     **
101     ** What registers/RAM may be used if error exit (POLL only)?:
102     **      A,B,C,D,DO,D1,P,RO
103     **      (Not available: R1,R2,R3,R4,ST, scratch RAM)
104     **
105     ** NOTE:
106     **      The pWARN poll (and other message polls) are usually
107     **      "handled" without setting XM=0. This is to allow
108     **      all LEX files to get a chance to intercept the poll.
109     **
110     **      A LEX file which intercepts the poll has essentially

```

```

111      four choices:
112      **      1) Abort the warning message, continue executing
113      **          or whatever else it wants to do (including
114      **          jumping instead to the error routine).
115      **      2) Change the values in R0 to cause a different
116      **          warning to be reported, or to cause different
117      **          entry conditions as selected by the value in
118      **          R0(S), or to cause different text insertion
119      **          by changing the values in R2 (text insertion
120      **          applies only to certain rare messages). Then
121      **          allow the poll to return to the warning routine
122      **          with XM=1.
123      **      3) Simply clear XM ("poll handled"). This causes
124      **          the message to be suppressed; message driver
125      **          returns immediately (without setting ERRN, etc.)
126      **      4) If error is generated by poll handler, set carry
127      **          and load error number in C(3-0). This will
128      **          cause a jump to BSERR with the new error number.
129      **
130      **
131      ** Envisioned application(s):
132      **      A) Foreign Language Translators: if the warning message
133      **          number is from the appropriate LEX file, the message
134      **          number in R0 is adjusted to generate the translator's
135      **          message. (If a type {5} building block is included
136      **          in the message, this will have to be adjusted through
137      **          a nested pTRANS poll, too. See IDS volume I, chapter
138      **          "Message Handling".) Set XM=1 and return.
139      **      B) Say a LEX file intercepts all warnings, writes the
140      **          message number (ERRN) and line number (ERRL) to a
141      **          file, and suppresses the display of the warning.
142      **          When intercepting this poll, it would do the
143      **          necessary processing and return with XM=0.
144      **      C) Say another operating system will not allow any
145      **          warnings to be issued, only errors. It could
146      **          intercept the pWARN poll and jump directly to
147      **          BSERR so that the warning is converted into an error.
148      **      D) An automated card puller (!?!) might trap the
149      **          appropriate card reader messages and use them as
150      **          prompts when to insert and pull cards.
151      **
152      **
153      ** History:
154      **
155      **      Date      Programmer      Modification
156      **      -----      -
157      **      10/05/82    MB            Documentation
158      **      01/27/83    MB            Added "poll handled" suppress
159      **
160      ****
161      ****

```

```

174          **
175          ** Should poll be "Handled" (return with XM=0)?:
176          ** Only if you want the message to be entirely suppressed.
177          ** Most applications will "handle" the poll without
178          ** setting XM=0 (see below).
179          **
180          ** Meaning of "Handling" Poll (what does code do if XM=0?):
181          ** It's up to you. For instance, a LEX file might want to
182          ** intercept all errors and warnings to write them to a
183          ** file; in this case, do your thing and return with XM=0
184          ** so that the message is suppressed.
185          **
186          ** Entry conditions for handler (registers, ST, RAM, etc.):
187          ** B[A] = Poll number.
188          ** HEX mode.
189          ** P=0.
190          **
191          **
192          **      F E D C B A 9 8 7 6 5 4 3 2 1 0
193          **      | | ^ | | | | | | | | | | | |
194          **      | | ^ | | | | | | | | | | | |
195          **      | | ^ | | | | | | | | | | | |
196          **      | | ^ | | | | | | | | | | | |
197          **      | | ^ | | | | | | | | | | | |
198          **      | | ^ | | | | | | | | | | | |

201          **      | | ^ | | | | | | | | | | | |
202          **      | | ^ | | | | | | | | | | | |
203          **      | | ^ | | | | | | | | | | | |
204          **      | | ^ | | | | | | | | | | | |
205          **      | | ^ | | | | | | | | | | | |
206          **      | | ^ | | | | | | | | | | | |
207          **      | | ^ | | | | | | | | | | | |
208          **      | | ^ | | | | | | | | | | | |
209          **      | | ^ | | | | | | | | | | | |
210          **      | | ^ | | | | | | | | | | | |
211          **      | | ^ | | | | | | | | | | | |
212          **      | | ^ | | | | | | | | | | | |
213          **      | | ^ | | | | | | | | | | | |
214          **      | | ^ | | | | | | | | | | | |
215          **      | | ^ | | | | | | | | | | | |
216          **      | | ^ | | | | | | | | | | | |

```

control codes for text insertion
+ Entry P value (see MFERR*)
LEX ID of message
message number

If parse error (identified by bit3 in R0(S)=1xxx):
Address in INBS points to input stream
A(A)= address of error within input stream

Normal exit conditions from handler if handled (ST, RAM, registers, etc.):
Carry clear.
HEX mode.
XM=0.
no other requirements -- the message will be suppressed

Normal exit conditions from handler if not handled (ST, RAM, registers, etc.):
Carry clear.
HEX mode.
XM=1.

```
217      **      RO can be changed as needed to adjust msg (see MFERR*)
218      **
219      ** Error exit conditions from handler:
220      **      Carry set.
221      **      HEX mode.
222      **      C[0-3] = Error number.
223      **      P= value to select options in MFERR* (caution: do not
224      **      select a parse error in this manner -- A(A) cannot
225      **      pass information back through the poll. i.e., do
226      **      not set bit3 in P. If such a thing is necessary,
227      **      the appropriate action is to abort the poll and
228      **      jump directly to BSERR, MFERR or MFERR*.)
229      **
230      ** Available subroutine levels:
231      **      5
232      **
233      ** What registers/RAM may be used if handled?:
234      **      A,B,C,D,DO,D1,P,RO
235      **      (Not available: R1,R2,R3,R4,ST, scratch RAM)
236      **
237      ** What registers/RAM may be used if not handled?:
238      **      A,B,C,D,DO,D1,P,RO (change RO only to affect msg)
239      **      (Not available: R1,R3,R4,ST, scratch RAM.
240      **      R2 unavailable except for rare cases when insertion
241      **      text is being passed to the msg routines.)
242      **
243      **      NOTE: If a parse error (bit3 in RO(S)=1xxx),
244      **      then DO NOT call I/OALL, IODALL -- DO
245      **      NOT allocate, deallocate or adjust the
246      **      length of any I/O buffer! DO NOT change
247      **      the value in AVMEMS or INBS! (I/O buffer
248      **      routines move I/O buffer memory and change
249      **      AvMemSt.) These pointers may be changed
250      **      if the error is NOT a parse error.
251      **
252      ** What registers/RAM may be used if error exit (POLL only)?:
253      **      A,B,C,D,DO,D1,P,RO
254      **      (Not available: R1,R2,R4,ST, scratch RAM.
255      **      R3 is unavailable unless the error is a parse error;
256      **      i.e., if RO(S)=1xxx.)
257      **
258      ** NOTE:
259      **      The pERROR poll (and other message polls) are usually
260      **      "handled" without setting XM=0. This is to allow
261      **      all LEX files to get a chance to intercept the poll.
262      **
263      **      Remember, if a parse error, do NOT change the values
264      **      in AVMEMS or INBS! This prohibits any adjustment (or
265      **      allocation/deallocation) of I/O buffer length.
266      **
267      **      A LEX file which intercepts the poll has essentially
268      **      four choices:
269      **      1) Abort the error message, continue executing
270      **      or whatever else it wants to do (including
271      **      jumping instead to the warning routine).
```

```

272      **      2) Change the values in R0 to change the format
273      **      of the message:
274      **      i) change R0(4-0) to generate a different
275      **      message
276      **      ii) change R0(S) to select different options
277      **      (see MFERR*). However, bit3 in R0(S)
278      **      CANNOT be changed! Bit3 in R0(S) indicates
279      **      a parse error; if you need to change this,
280      **      the appropriate way is to jump directly to
281      **      BSERR, MFERR or MFERR* with your own entry
282      **      conditions.
283      **      iii) change the values in R2 to change text
284      **      insertion (text insertion applies only to
285      **      certain rare messages).
286      **      Then allow the poll to return to the error
287      **      routine with XM=1.
288      **      3) Simply clear XM ("poll handled"). This causes
289      **      the message to be suppressed; message driver
290      **      returns immediately (without setting ERRN or
291      **      ERRRL, without checking ON ERROR!)
292      **      4) If error is generated by poll handler, set carry
293      **      and load error number in C(3-0). This will
294      **      cause the new error to be displayed.
295      **      In addition, the poll handler may perform any
296      **      housekeeping type functions, such as cleaning up
297      **      pending operations.
298      **
299      **      Envisioned application(s):
300      **      A) Foreign Language Translators: if the error message
301      **      number is from the appropriate LEX file, the message
302      **      number in R0 is adjusted to generate the translator's
303      **      message. (If a type {5} building block is included
304      **      in the message, this will have to be adjusted through
305      **      a nested pTRANS poll, too. See IDS volume I, chapter
306      **      "Message Handling".) Set XM=1 and return.
307      **      B) Say a LEX file intercepts all errors, writes the
308      **      message number (ERRN) and line number (ERRRL) to a
309      **      file, and suppresses the display of the error.
310      **      When intercepting this poll, it would do the
311      **      necessary processing and return with XM=0.
312      **      C) Say another operating system prevents any error from
313      **      halting execution; instead it issues warnings and
314      **      recovers without user intervention. It could
315      **      intercept the pERROR poll and jump directly to
316      **      MFWRN so that the error is converted into a warning.
317      **      MFWRN is a subroutine, so processing would return
318      **      to this operating system.
319      **
320      **      History:
321      **
322      **      Date      Programmer      Modification
323      **      -----      -

```

329      EJECT
330      ****
331      ****
332      **
333      ** Name:(S) pMEM    -  Memory error poll
334      **
335      ** Category:    POLL
336      **
337      ** Type:        FPOLL
338      **
339      ** Purpose:
340      **      Alert LEX files that an "Insufficient Memory" error
341      **      is about to be reported.
342      **
343      ** Should poll be "Handled" (return with XM=0)?:
344      **      Only if you want the message to be entirely suppressed.
345      **      Most applications will "handle" the poll without
346      **      setting XM=0 (see below).
347      **
348      ** Meaning of "Handling" Poll (what does code do if XM=0?):
349      **      It's up to you.  For instance, a LEX file might want to
350      **      intercept all errors and warnings to write them to a
351      **      file; in this case, do your thing and return with XM=0
352      **      so that the message is suppressed.
353      **
354      ** Entry conditions for handler (registers, ST, RAM, etc.):
355      **      B[A] = Poll number.
356      **      HEX mode.
357      **      P=0.

374      **            |      |      |      |      |      |
375      **            |      |      |      |      |      |
376      **            |      |      |      |      |      |
377      **            |      |      |      |      |      |
378      **            |      |      |      |      |      |
379      **            |      |      |      |      |      |
380      **            |      |      |      |      |      |
381      **            |      |      |      |      |      |
382      **            |      |      |      |      |      |
383      **            |      |      |      |      |      |

```

```
384      **      RO can be changed as needed to adjust msg (see MEMER*)
385      **
386      ** Available subroutine levels:
387      **      3
388      **
389      ** What registers/RAM may be used if handled?:
390      **      A,B,C,D,DO,D1,P,RO
391      **      (Not available: R1,R2,R3,R4,ST, scratch RAM)
392      **
393      ** What registers/RAM may be used if not handled?:
394      **      A,B,C,D,DO,D1,P
395      **      RO: change RO(3-0) to modify message
396      **      RO: change RO(14-13) to allow text insertion
397      **      (only if you're the LEX file that originated
398      **      the message, and know what you're doing).
399      **      (Not available: R1,R2,R3,R4,ST, scratch RAM.)
400      **
401      **
402      ** NOTE:
403      **      The pMEM poll (and other message polls) are usually
404      **      "handled" without setting XM=0. This is to allow
405      **      all LEX files to get a chance to intercept the poll.
406      **
407      **      The message number is usually eMEM (18 hex, 24 dec).
408      **      But any LEX file can call the MEMER* routine with its
409      **      own message number; the fact that it called MEMER*
410      **      means that it is reporting insufficient memory.
411      **
412      **      The MEMERR routine uses the leeway area in available
413      **      memory as a building buffer; there is only enough room
414      **      for about 80 characters, plus prefix. If a poll
415      **      handler substitutes another message number, it cannot
416      **      exceed an 80 character limit (a message should never
417      **      be longer than about 25 characters, anyway). If it
418      **      does, the computer would enter an infinite MEMERR loop.
419      **
420      **      A LEX file which intercepts the poll has essentially
421      **      four choices:
422      **      1) Abort the error message, continue executing
423      **      or whatever else it wants to do (including
424      **      jumping instead to the warning routine).
425      **      2) Change the values in RO to change the format
426      **      of the message:
427      **          i) change RO(4-0) to generate a different
428      **             message
429      **          ii) change RO(S) to select different options
430      **              (see MFERR*). However, bit3 in RO(S)
431      **              CANNOT be changed! Bit3 in RO(S) indicates
432      **              a parse error; if you need to change this,
433      **              the appropriate way is to jump directly to
434      **              BSERR, MFERR or MFERR* with your own entry
435      **              conditions.
436      **      Then allow the poll to return to the error
437      **      routine with XM=1.
438      **      3) Simply clear XM ("poll handled"). This causes
```

```

439      **      the message to be suppressed; message driver
440      **      returns immediately (without setting ERRN or
441      **      ERRL, without checking ON ERROR!)
442      **      4) Replace the address in level 1 of the RSTK
443      **      (counting from 0) with its own address, so
444      **      that after the message is displayed, processing
445      **      returns to itself.
446      **      In addition, the poll handler can perform any
447      **      housekeeping type functions (such as cleaning up
448      **      pending operations).
449      **
450      **      One other option deserving mention is that of
451      **      generating a memory error which calls for text
452      **      insertion. For instance, say an external system
453      **      has 6 different files open, and is writing to
454      **      them randomly; it reaches insufficient memory
455      **      while writing to FILE4, so wants to report:
456      **      Write Limit: FILE4
457      **      using a text insertion point to pass "FILE4".
458      **      Before calling MEMER*, set up R2 for insertions.
459      **      When handling the pMEM poll, verify that this is
460      **      indeed your message, adjust R0(14-13) to contain
461      **      the insertion codes, and return with XM=1.
462      **
463      **      Envisioned application(s):
464      **      A) Foreign Language Translators: if the error message
465      **      number is from the appropriate LEX file, the message
466      **      number in R0 is adjusted to generate the translator's
467      **      message. Set XM=1 and return.
468      **      B) Say a LEX file intercepts all errors, writes the
469      **      message number (ERRN) and line number (ERRL) to a
470      **      file, and suppresses the display of the error.
471      **      When intercepting this poll, it would do the
472      **      necessary processing and return with XM=0.
473      **      C) Say another operating system prevents any error from
474      **      halting execution; instead it issues warnings and
475      **      recovers without user intervention. It could
476      **      intercept the pERROR poll and jump directly to
477      **      MFWRN so that the error is converted into a warning.
478      **      MFWRN is a subroutine, so processing would return
479      **      to this operating system.
480      **

647          **      If desired message has text insertion points:
648          **      R2 register: source of text insertion.
649          **      C(14): type of insertion.
650          **      C(13): how many characters in insertion.
651          **
652          **      R2
653          **      ----
654          **      = actual output characters if C(14)= 1xxx
655          **      = address of output characters if C(14)= 0xxx
656          **      = additionally, if C(14)= 0000, upper byte
657          **                  of R2 contains control nibbles.
658          **
659          **      C(14)
660          **      ----
661          **      1xxx   use contents of R2 register as output
662          **      0xxx   use address in R2 register to find output
663          **
664          **      x000   Output is already in ASCII form

```

```

665      **
666      **
667      **      Digit output (digits can be Hex or Dec):
668      **      x001  Digit output-- replace leading 0's w/blanks
669      **      x010  Digit output-- don't suppress leading 0's
670      **      x011  Digit output-- suppress leading 0's
671      **
672      **
673      **      Hex-to-Dec conversions always generate
674      **      decimal numbers with 7 digits:
675      **      x100  Hex-to-Dec: suppress up to 3 leading 0's
676      **      x101  Hex-to-Dec: suppress up to 4 leading 0's
677      **      x110  Hex-to-Dec: suppress up to 5 leading 0's
678      **      x111  Hex-to-Dec: suppress up to 6 leading 0's
679      **
680      **      C(13)
681      **      -----
682      **      For C(14)= 1000 ("ASCII output is in R2")
683      **      C(13)= #nibbles-1 to be output. Hence the
684      **      #nibs MUST be even!!; C(13) odd. E.g.,
685      **      if 5 chars for output, C(13)=9.
686      **
687      **      For C(14)= x0xx (hex or dec digit output)
688      **      C(13)= #digits-1 to be output, hence
689      **      no more than 16.
690      **
691      **      For C(14)= x1xx (hex-to-dec conversion)
692      **      C(13)= #digits-1 in number to be converted
693      **      Max hex value for conversion is FFFF
694      **      (1048575 dec), hence C(13) must be 4
695      **      or less.
696      **
697      **      For C(14)= 0000 ("ASCII output from DAT1")
698      **      C(13)= 0: no output
699      **      1: Send out specified number of
700      **      character; R2(15-14)= #chars-1.
701      **      2: Send out chars until ASCII termin-
702      **      ator is found. ASCII terminator
703      **      is passed in R2(15-14) (usually
704      **      an FF terminator, but any byte
705      **      value can be used).
706      **
707      **
708      **
709      **      Entry for MFWRQ8:
710      **      Same as for MFWRNQ, except that P will be set
711      **      explicitly to 8. Processing then falls into MFWRNQ.
712      **
713      **      Exit:
714      **      P      = 0
715      **      Carry set
716      **
717      **      Calls:  POLL, SFlag?, KILLKY, FCALC?, CRLFND, UPDCRL,
718      **              SflagC, TBMSID, DOASCI, TBMSTX, A=CUR, AVS=C,

```

```

720      **          R<RST2, RST2<R
721      **
722      ** Uses.....
723      ** Exclusive: R(W), B(W), C(W), D(W), P, DO, D1, R0
724      **          R2 (only if text insertion; otherwise not used)
725      ** Inclusive: Same
726      **
727      ** Stk lvs: 2
728      **
729      ** NOTE:
730      **     If the message constant is eMEM (18 hex), the message
731      **     routines will automatically invoke MEMERR, and issue
732      **     an Insufficient Memory error.
733      **
734      ** Detail:
735      **     Example of text insertion:
736      **     Message #5 in the mainframe is TFM WRN L{5}:{6},
737      **     where {5} indicates an insertion point for a line
738      **     number, and {6} indicates an indirect reference to
739      **     another message. If we wanted to display
740      **     TFM WRN L145:Syntax (Syntax is msg #4Bhex)
741      **     we could pass the line number in R2 with the
742      **     appropriate control codes in C (x=don't care):
743      **     R2= xxxxxxxx004Bx0145
744      **           0145= dec digits for output
745      **           004B= indirect message number
746      **
747      **     C= xB3xxxxxxxxx0088
748      **           0088= desired warning message
749      **           3=#digits-1 to be output
750      **           B=1xxx: use contents of R2
751      **           x011: digit output, suppress leading 0's
752      **
753      **     Or, alternatively,
754      **     R2= xxxxxxxx004Baaaaa
755      **           aaaaa= address to find digits
756      **           004B= indirect message number
757      **
758      **     C= x33xxxxxxxxx0088
759      **           0088= desired warning message
760      **           3=#digits-1 to be output
761      **           3=0xxx: use address in R2
762      **           x011: digit output, suppress leading 0's
763      **
764      **     Or,...
765      **     R2= xxxxxxxx004Bxxx91
766      **           91hex=145 decimal
767      **           004B= indirect message number
768      **
769      **     C= xF1xxxxxxxxx0088
770      **           0088= desired warning message
771      **           1=#digits-1 to be converted to decimal
772      **           F=1xxx: use contents of B register
773      **           x111: suppress up to 6 leading 0's
774      **

```

```

775      Or,...
776      R2= 03xxxxx004Baaaaa
777      aaaaa= address to find ASCII output
778      004B=indirect message number
779      03=#characters-1 to be output
780
781      C= x01xxxxxxxxx0088
782      0088= desired warning message
783      1= output number of chars found in R2(15-14)
784      0=output is in ASCII form already, resides at
785      address found in R2.
786

```

History:

Date	Programmer	Modification
06/29/82	MB	documentation
01/27/83	MB	Poll error handle, XM=0 suppress
03/04/83	MB	Saved 3 RSTK levels
04/11/83	MB	Added KILLKY call.

822      ** Name:(S) MFERR* - Error message driver
823      ** Name:   MFERR- - Error message driver
824      **
825      ** Category:  GENUTL
826      **
827      ** Purpose:
828      **      Display error messages from standard message tables.
829      **
830      ** Entry:
831      **
832      ** (1)-----
833      **
834      **      P= 1xxx   This is a Parse error (i.e., re-
835      **                  display input line w/cursor backup)
836      **      x1xx   Do not store ERRN
837      **                  (Else store ERRN and ERRL)
838      **      xx1x   Display msg only (Else display
839      **                  "ERR:" or "ERR L:", too)
840      **      bit0 not used at present (**)
841      **
842      **
843      **
844      ** (2)-----
845      **
846      **      C(B)= message ID number in Hex.
847      **      C(3-2)= LEX ID# in Hex (=00 for mainframe tbl)
848      **
849      **
850      **
851      ** (3)-----
852      **
853      **      If P=1xxx (parse error):
854      **      INBS points to first char of INput Buffer, with
855      **      a 3 nibble length field preceding it.
856      **
857      **      D1 points to char in input buffer w/error
858      **
859      **      A(A)= Address of prompt string for input
860      **                  re-display (prompt must be enclosed in
861      **                  delimiters, both sides. Delimiters
862      **                  can be any byte value. E.g., prompt
863      **                  string for an editor might look
864      **                  like xCnd:x , where x's are any
865      **                  matching byte value.)
866      **      or =0 For "use BASIC prompt string" (defaults
867      **                  to the prompt string 3>3, where the
868      **                  3's are the matching delimiters).
869      **
870      **
871      **      (**) Bit0 of the P register is reserved for future
872      **                  applications, as a way for the LEX file which
```

```

873      **      generated the error to communicate with other
874      **      LEX files; this bit can be detected during the
875      **      pERROR poll in RO(S). The meaning of this bit
876      **      is not yet decided. In the meantime, bit0 must=0.
877      **
878      ** Entry for MFERR- :
879      **      DO is C(3-0) above.
880      **
881      **
882      ** Exit:
883      **      P      = 0
884      **
885      ** Calls:      POLL, FCALC?, CRLFND, UPDCRL,
886      **              SflagC, TBMSID, DOASCI, TBMSIX, A=CUR, AVS=C,
887      **              AVS2DS, CHIRP, XDELAY, CRLFSD, BLDDSP, MFLG=X,
888      **              R<RST2, RST2<R. Might jump to ONERR.
889      **      Parse errors also call:
890      **              CKINF-, DSPBUF, DSPCNA, DSPCHA, CURSFL, CURSRR,
891      **              ESCSEQ
892      **
893      ** Uses.....
894      **      Exclusive: A(W), B(W), C(W), D(W), P, DO, D1, RO
895      **              R2 (only for MFERRsp entry with text insertion;
896      **                  otherwise not used)
897      **              S13 is tested for: "Running program?"
898      **                  If you're calling this routine just for
899      **                  message display, watch out for S13!!!
900      **              Available Memory (starting at AvMemSt) is
901      **                  also used as a building buffer for msg.
902      **      PARSE ERRORS also use:
903      **              R3 (stores prompt address and #cursor-rights)
904      **              R1, R2 (used in SENDWD)
905      **              STMTRO (in CKINFO and SENDWD)
906      **      Inclusive: Same
907      **
908      ** Stk lvls: 1 (parse errors only)
909      **              2 (all other errors)
910      **
911      ** NOTE:
912      **      Parse errors re-prompt and rebuild the input line. The
913      **      prompt is built in the display observing WIDTH. This is
914      **      not a problem with the BASIC prompt (">"), since it is
915      **      only one character; but an external system using a multi-
916      **      character prompt should be aware that the prompt, after
917      **      a parse error, may be split between two lines. (This
918      **      feature was incorporated to accomodate INPUT prompts.)
919      **
920      **      Messages are built in Available Memory, which is used as
921      **      a temporary buffer. This can cause a MEMERR; see the
922      **      MEMERR routine for details.
923      **
924      **      If the error message number at entry is the eMEM constant
925      **      (18hex), the message routines will automatically invoke
926      **      the MEMERR routine, and an Insufficient Memory error will
927      **      result.

```

```

928      **
929      ** Any error entering through MFERR* (includes MFERR and
930      ** BSERR) disallows text insertion. Some applications may
931      ** construct error messages which allow text insertion; if
932      ** you want to issue these messages as errors you have
933      ** three choices:
934      ** 1) Issue them without any text insertion (use MFERR*,
935      ** MFERR or BSERR)
936      ** 2) Issue them as warnings, made to look like errors
937      ** (use MFWRN) (see IDS volume I, chapter "Message
938      ** Handling").
939      ** 3) Call MFERSp entry point (see MFERSp heading).
940      **
941      **
942      ** Detail:
943      ** RO usage:
944      ** F E D C B A 9 8 7 6 5 4 3 2 1 0
945      ** -----
946      ** | | | | | | | | | | | | | |
947      ** -----
948      ** | | +- wrng or error +- msg number
949      ** | +- insert codes
950      ** +- option flags
951      **
952      ** Algorithm:
953      ** (1) Put option flags in C(S).
954      ** Save options and LEX#, msg# in RO.
955      ** Call POLL
956      ** If Parse error, calculate #backups and store
957      ** with A(A) in R3.
958      ** If eMEM constant, branch to MEMERR.
959      ** MFER.6 If "don't store error#" option go to (2)
960      ** Else, store error# in ERR#.
961      ** If running program (S13=1), store Line#.
962      ** (2) If running program (S13=1), and not a warning,
963      ** and ON ERROR in effect, branch to ONERR.
964      ** If "message text only" option, go to (4)
965      ** Build LEX ID prefix for message.
966      ** Build "ERR" or "ERR L".
967      ** If running program (S13=1), build line#.
968      ** Build ":"
969      ** (4) Build message text.
970      ** Display entire message.
971      ** Beep.
972      ** Send CR, LF.
973      ** If warning, return.
974      ** If not parse error and S13=1, position DO
975      ** to line# or @, return.
976      ** (Parse error:)
977      ** Set up CKINFO for SENDWD, send out prompt.
978      ** Redisplay input line.
979      ** Move cursor far left.
980      ** Send out required # of cursor-rights.
981      **

1262      ** Uses.....
1263      ** Exclusive: A(W), B(W), C(W), D(W), P, DO, D1, RO
1264      ** S13 is tested for: "Running program?"
1265      ** If you're calling this routine just for
1266      ** message display, watch out for S13!!!
1267      ** Available Memory (starting at AvMemSt) is
1268      ** also used as a building buffer for msg.
1269      ** Inclusive: Same

```

```

1270      **
1271      ** Stk lvls:  2
1272      **
1273      ** NOTE:
1274      ** The entry point MEMER* allows ANY message to be
1275      ** reported in lieu of "Insufficient Memory", and still
1276      ** be handled as a memory error. This means you can
1277      ** display, say, "Out of Scratch Area" as a way of
1278      ** reporting a memory error. This capability is included
1279      ** to allow external systems to generate memory errors
1280      ** and report them as they desire. But this capability
1281      ** can cause serious conditions (such as an infinite
1282      ** MEMERR loop) if some rules are not followed:
1283      **      1) Never invoke MEMER* (or MEMERR or MEMERX) as
1284      **          a parse error.
1285      **      2) Any error entering through MEMER* (includes
1286      **          MEMERR and MEMERX) disallows text insertion.
1287      **          This can be overridden in the pMEM poll. But
1288      **          never use a message which contains a type{5}
1289      **          insertion!!! A type{5} insertion may cause
1290      **          a slow pTRANS poll to be issued, which may
1291      **          cause an infinite MEMERR loop.
1292      **
1293      ** The preferred way for a LEX file operating in the
1294      ** BASIC system to generate a different memory error
1295      ** (i.e., other than "Insufficient Memory"), is to call
1296      ** MEMERR and then intercept the pMEM poll to change the
1297      ** message number or options. On the other hand, a
1298      ** LEX file which wants to generate a memory error which
1299      ** takes text insertions should set up the insertion
1300      ** codes in R2, call MEMER* with the appropriate message
1301      ** number, and adjust C(14-13) during the pMEM poll.
1302      **
1303      ** Detail:
1304      **      RO usage:
1305      **          F E D C B A 9 8 7 6 5 4 3 2 1 0
1306      **          -----
1307      **          | |   |F|               |   |
1308      **          -----
1309      **          | | +- error code      +- msg number
1310      **          | +- insert codes
1311      **          +- option flags
1312      **
1313      ** Algorithm:
1314      **      (1) Put option flags in C(S).
1315      **          Save options and LEX#, msg# in RO.
1316      **          Set C(14-12)=OOF (suppresses text insertions)
1317      **          Call FPOLL
1318      **          Collapse Available Memory
1319      **          Turn off AUTO mode
1320      **          Check if TRANSFORM in effect (this essentially
1321      **              include TRANSFORM in the poll); if so
1322      **              branch back to TRANSFORM.
1323      **          Jump to MFER.6 (see MFERR*)

2240          **      ----
2241          **          1xxx  use contents of B register as output
2242          **          0xxx  use address in D1 to find output
2243          **
2244          **          x000  Output is already in ASCII form
2245          **
2246          **      Digit output (digits can be Hex or Dec):
2247          **          x001  Digit output-- replace leading 0's with blanks
2248          **          x010  Digit output-- don't suppress leading 0's
2249          **          x011  Digit output-- suppress leading 0's
2250          **
2251          **
2252          **      Hex-to-Dec conversions always generate
2253          **      decimal numbers with 7 digits:
2254          **          x100  Hex-to-Dec: suppress up to 3 leading 0's
2255          **          x101  Hex-to-Dec: suppress up to 4 leading 0's

```

```

2256      **      x110   Hex-to-Dec: suppress up to 5 leading 0's
2257      **      x111   Hex-to-Dec: suppress up to 6 leading 0's
2258      **
2259      **
2260      **      C(0)
2261      **      -----
2262      **      For C(1)= 1000 ("ASCII output is in B")
2263      **      C(0)= #nibbles-1 to be output. Hence the
2264      **      #nibs MUST be even!!; C(0) odd. E.g.,
2265      **      if 5 chars for output, C(0)=9.
2266      **
2267      **      For C(1)= x0xx (hex or dec digit output)
2268      **      C(0)= #digits-1 to be output, hence
2269      **      no more than 16.
2270      **
2271      **      For C(1)= x1xx (hex-to-dec conversion)
2272      **      C(0)= #digits-1 in number to be converted
2273      **      Max hex value for conversion is FFFF
2274      **      (1048575 dec), hence C(0) must be 4
2275      **      or less.
2276      **
2277      **      For C(1)= 0000 ("ASCII output from DAT1")
2278      **      C(0)= 0: no output
2279      **      1: Send out specified number of
2280      **      character; B(15-14)= #chars-1.
2281      **      2: Send out chars until ASCII termin-
2282      **      ator is found. ASCII terminator
2283      **      is passed in B(15-14) (usually
2284      **      an FF terminator, but any byte
2285      **      value can be used).
2286      **
2287      ** Entry for DOASC+:
2288      **      This entry point is for "ASCII output from DAT1"
2289      **      only:
2290      **      D1 points to output already in ASCII form
2291      **      C(15-14)= #bytes to output
2292      **      DOASC+ then sets C(B)=01 for appropriate codes.
2293      **
2294      ** Exit: (May exit through MEMERR if not enough memory)
2295      **      Carry clear
2296      **      P      = 0
2297      **      B(A) = # bytes left in available memory past buffer.
2298      **      D0 points to FF terminator, ready for another call.
2299      **
2300      ** Calls:      HEXDEC (only for hex-to-dec conversion;
2301      **              i.e., only if C(1)=x1xx)
2302      **              MOVEU3 (only for ASCII output from DAT1;
2303      **              i.e., only if C(1)=0000)
2304      **
2305      ** Uses.....
2306      **      P, A(W), B(W), C(W), D(15-13)
2307      **      D0
2308      **      Uses D1 only if C(1)=0 (i.e., only if ASCII output
2309      **      from DAT1; otherwise D1 not changed). And then,
2310      **      D1 is only moved past source ASCII.

```

```

2311      **
2312      ** Stk lvs: 1
2313      **
2314      ** Detail:
2315      **   Fills DAT0 with characters from B register or from DAT1
2316      **   (as specified by calling routine). An FF terminator
2317      **   is placed at the end of the buffer, ready for a call
2318      **   to BF2DSP or BF2STK.
2319      **   AvMemEnd is checked for sufficient memory. This is
2320      **   why D0 at entry must be less than AvMemEnd.
2321      **
2322      **   If ASCII output from DAT1, maximum #characters is 255.
2323      **   If digit output, maximum number of digits is 16. If
2324      **   ASCII from B, maximum number of characters is 8.
2325      **
2326      **   If source is HEX or BCD digits, converts to ASCII
2327      **   equivalents first, for output to DAT0.
2328      **
2329      **   For numeric Hex-to-Dec output, conversion to BCD is
2330      **   performed, then converted to ASCII for output to
2331      **   DAT0.
2332      **
2333      ** Algorithm:
2334      **   Copy control nibs from C to D, calculate
2335      **   #bytes in AvMEM.
2336      **   Do:
2337      **     If ASCII output, copy bytes to DAT0.
2338      **     If Hex-to-Dec, call to HEXDEC, then digit output.
2339      **     If Digit output, convert digits to ASCII and output.
2340      **     As chars are output, decrement #bytes in AvMEM.
2341      **     Terminate buffer with FF.
2342      **

2688 09A91 467		GOC	TBMS31	Yes.
2689 09A94 BF2		CSL	W	
2690 09A97 D9		C=B	A	Flags to C(0), end up in C(XS).
2691 09A99 812		CSLC		
2692 09A9C 812		CSLC		C(B)= DOASCII codes.
2693 09A9F 96A		?C=0	B	Any text?
2694 09AA2 6B		GOYES	TBMS15	No. Don't wipe out R2.
2695 09AA4 112		A=R2		Yes.
2696 09AA7 AF8		B=A	W	Either B= text, or upper B
2697	*			=codes and DAT1= text.
2698 09AAA A2E		C=C-1	XS	Insert indirect message?
2699 09AAD 426		GOC	TBMS35	Yes.
2700 09AB0 133		AD1EX		No. Insert text.
2701 09AB3 102		R2=A		Save message addr in R2.
2702 09AB6 92A		?C=0	XS	Trailing space?
2703 09AB9 01		GOYES	TBMS20	No. Text to buffer only.
2704 09ABB 747D		GOSUB	DOASCII	Output text to buffer.
2705 09ABF 3102		LCASC	\\	Send trailing blank.
2706 09AC3 D5		B=C	■	Blank to B,
2707 09AC5 3118		LCHEX	81	codes in C.
2708 09AC9 766D	TBMS20	GOSUB	DOASCII	
2709 09ACD 7570		GOSUB	CSRW9-	Fetch msg address.
2710 09AD1 10A		R2=C		2nd insert to R2(A), D1=msg addr.
2711 09AD4 538	TBMS21	GONC	TBMS15	(BET) To next msg cell.
2712	*			
2713 09AD7 902	TBMS23	?A=C	P	Stop output?
2714 09ADA 71		GOYES	TBMS27	Yes.
2715 09ADC CE		C=C-1	■	C(0)= B.
2716 09ADE 982		?A<C	P	A(0)= #chars-1 to output?

2717	09AE1	70		GOYES	TBMS25	Yes.
2718	09AE3	170		D1=D1+	!	No. #chars-1 in next nib.
2719	09AE6	F4		ASR	A	#chars-1 to A(0).
2720	09AE8	D6	TBMS25	C=A	A	C(0)= #chars-1 to output.
2721	09AEA	753D		GOSUB	DOASC-	Text to buffer.
2722	09AEE	55E		GONC	TBMS21	(BET) Next cell.
2723			*			
2724	09AF1	118	TBMS27	C=RO		Fetch "return" msg addr.
2725	09AF4	94A		?C=0	3	Were we just searching for title?
2726	09AF7	00		RTNYES		Yes. Title found and sent.
2727	09AF9	8AA		?C=0	A	End of complete msg?
2728	09AFC	42		GOYES	TBMS39	Yes.
2729	09AFE	7740		GOSUB	CSRW9+	No. Address of next cell
2730	09B02	108		RO=C		to RO(A).
2731	09B05	5EC		GONC	TBMS21	(BET) Next cell.
2732			*			
2733	09B08	143	TBMS31	A=DAT1	A	Read new XROM msg number.
2734	09B0B	D8		B=A	A	To B.
2735	09B0D	4C0		GOC	TBMS37	(BET) Terminate curr msg.
2736			*			
2737	09B10	7230	TBMS35	GOSUB	CSRW9-	Next insert codes to R2(A).
2738	09B14	10A		R2=C		
2739	09B17	118		C=RO		To save RO(15-10).
2740	09B1A	29	TBMS37	P=	9	Terminate current msg,
2741	09B1C	629E		GOTO	TBMS01	call indirect msg#.
2742			*			
2743	09B20	7F0D	TBMS39	GOSUB	DOASCI	End of msg. Since C(A)=0, sends
2744			*			out FF terminator (consider
2745			*			null message).
2746	09B24	136		CDOEX		C=addr of FF at end of msg.
2747	09B27	D5		B=C	A	Copy addr to B.
2748	09B29	110		A=RO		To preserve upper RO.
2749			*			
2750			*	!!!!!!!	Fall into DO=AVS !!!!!!!	
2751			*

15          STITLE File Execute (FILXQ^)
16          *****
17          *****
18          **
19          ** Name:(S) FILXQ^ - Filename Execute
20          ** Name:(S) FILXQ$ - Filename Execute For a String Expression
21          **
22          ** Category:  FILUTL
23          **
24          ** Purpose:
25          **     Executes a tokenized file specifier. Solitary device
26          **     Specifiers of the form ':CARD', ':PORT', ':MAIN', etc,
27          **     are accepted. There are two entry points.
28          **
29          **     FILXQ^:
30          **     Assumes that D0 points to a file specifier in program
31          **     memory. The file specifier may be a literal or a
32          **     string expression.
33          **
34          **     FILXQ$:
35          **     Assumes that the alleged string has been evaluated and
36          **     is on the Math Stack. This entry is used by ADDR$ and
37          **     CAT$.
38          **
39          ** Entry:
40          **     FILXQ^:
41          **     D0 at start of file specifier
42          **     FILXQ$:
43          **     D1 points to string expression on top of Match Stack
44          **
45          ** Exit:
46          **     CARRY SET: (both entry points)
47          **     Mainframe-recognizable file specifier found.
48          **     R(W)  = Blank-padded file name if name present.
49          **           = 0 if only device specifier present, as in
50          **             ':MAIN', ':PORT', ':CARD'
51          **     D(S)  = F if no device specified
52          **           = 0 if device is :MAIN
53          **           = 1 if device in :PORT, in which case:
54          **               D(0) = PORT extender number 0-F
55          **               D(1) = PORT number          0-4
56          **               D(B) = FF if no PORT number specified
57          **           = 7 if device is card, in which case:
58          **               D(B) = 0 if :CARD
59          **               D(B) = Nonzero if :PCRD
60          **     D0    = Past file specifier (FILXQ^ only)
61          **     P      = 0
62          **     If file specifier was a string expression:
63          **         D1 points past the string on the stack
64          **     If file specifier was a literal containing a port#:
65          **         D1 points past the 16 nibble number on the stack
66          **         (AVMEME)=D1
67          **
68          **     CARRY CLEAR:
69          **     FILXQ^:

```

```

70      **      Executed illegal mainframe file name. Either string
71      **      expression or literal name with over 8 characters.
72      **      S7=1 => Specifier was string expression, in which
73      **      case the expression is still on the stack.
74      **      AVNEME points to the string header
75      **      DO points past the tokenized expression.
76      **
77      **      S7=0 => Specifier was literal; DO may be restored
78      **      to the start of the literal by using (STMTDO)
79      **      P = 0
80      **
81      **      FILXQ$:
82      **      String expression on stack contained an illegal specifier
83      **      S7 = 1
84      **      AVNEME = Value it contained on entry. May be used to
85      **      preserve the pointer to the string header prior
86      **      to calling FILXQ$.
87      **      P = 0
88      **
89      **      ERROR EXIT (both entry points):
90      **      Exit to MFERR (eFSPEC) if and only if :PORT is found,
91      **      followed by an illegal port specifier.
92      **
93      **
94      **      Calls: EXPEXC, FILEP, PDEV, CATCHR, DVCTYP, POLL,
95      **      REVPOP, BLKOK, PRTP, FINDA, RSTST, SAVEDO,
96      **      CNVWUC, AVE=D1
97      **      Uses.....
98      **      Exclusive: A-D, D1, DO, STMTDO, R0, R1, S1,S2,S7
99      **      Inclusive: STMTR1 (all of it) -- port spec. num expr
100     **      R0-R3, all of function scratch -- EXPEXC
101     **
102     **      NOTE: FILXQ$ entry doesn't use any statement scratch.
103     **
104     **
105     **      Detail: DO on entry to FILXQ^ is a pointer to the start
106     **      of the compiled file specification. FILXQ^ must
107     **      save DO in STMTDO, since EXPEXC can use all CPU
108     **      registers and all function scratch RAM. STMTDO
109     **      will be updated if memory moves.
110     **
111     **      SYNTAX FOR PORTN IS <d[.d[d]]>

```

```

125      ** 06/29/82 S.W.      Added documentation.
126      ** 07/05/82 S.W.      Modified code to eliminate
127      **                      call to POP1S - lets REV$
128      **                      take care of that.
129      ** 07/27/82 S.W.      Added code to check for tCOLON
130      **                      before assuming string expr.
131      ** 10/21/82 S.W.      Save PC in STMTDO, instead
132      **                      of S-R1-0
133      ** 01/31/83 J.P.      Clear S7 on entry
134      ** 06/28/83 S.W.      Save rtn stack level in R0
135      **                      prior to calling FILEP!.
136      **
137      ****
138      ****
139      *
140      ****
141      ****
142      **
143      ** Name:(S) pFILXQ - Poll for device to return device ID
144      **
145      ** Category:  POLL
146      **
147      ** Type:      POLL
148      **
149      ** Purpose:
150      **     Polls for dedicated device to intervene to return its id
151      **
152      ** Should poll be "Handled" (return with XM=0)?:
153      **     Yes
154      **
155      ** Meaning of "Handling" Poll (what does code do if handled?):
156      **     Reads device specifier (either as an executed string
157      **     expression off stack or as a literal) and if their
158      **     device is referenced, return device ID in D(S) & D(X)
159      **
160      ** Entry conditions for handler (registers, ST, RAM, etc.):
161      **     Carry clear
162      **     B[A] = Poll number.
163      **     HEX mode.
164      **     P=0.
165      **     R0 contains file name (if any) - <=8 characters
166      **     DO may be restored prior to filespec, using STMTDO
167      **     (this is generally not useful)
168      **     IF S7=0
169      **         Device specifier is a literal
170      **         DO points past tCOLON (Poll handler must check
171      **         to ensure that DO points to tLITRL - if it doesn't
172      **         poll should NOT be handled.
173      **     IF S7=1
174      **         Device specifier is a string on the stack
175      **         (string header pointed to by AVMEME)
176      **         DO points past the entire file specifier
177      **         A colon was found on the stack, in the appropriate
178      **         position.
179      **

```

```

180      ** Normal exit conditions from handler if handled (ST, RAM,
181      ** registers, etc.):
182      **      Carry clear
183      **      HEX mode.
184      **      XM=0.
185      **      File Name in A (Retrieve from R0 before exit)
186      **      D(S),D(X) set appropriately with device id
187      **      DO past file specifier
188      **      ADDITIONALLY:
189      **          IF S7=1 on entry, then D1 must point past the string
190      **          on the stack and AVMEME must reflect this.
191      **
192      ** Normal exit conditions from handler if not handled (ST, RAM,
193      ** registers, etc.):
194      **      Carry clear
195      **      HEX mode.
196      **      XM=1.
197      **      R0 must be unaltered from entry.
198      **
199      ** Error exit conditions from handler (POLL only):
200      **      NO ERROR - Instead DON'T HANDLE
201      **
202      ** Available subroutine levels:
203      **      6
204      **
205      ** NOTE:
206      **
207      **
208      ** What registers/RAM may be used if handled?:
209      **      A-D,D1,DO,R1,STMTTR1 (all of it), S1,S2
210      **
211      ** What registers/RAM may be used if not handled?:
212      **      A-D, DO, D1, P
213      **      R1,STMTTR1 (all of it), S1,S2
214      **
215      ** What registers/RAM may be used if error exit (POLL only)?:
216      **      NO error exit
217      **
218      ** Envisioned application(s):
219      **      So a dedicated device may be referenced analogous to an
220      **      HPIL device, eg > INITIALIZE :HP145XX
221      **
222      ** History:
223      **
224      **      Date      Programmer      Modification
225      **      -----
226      **      04/21/83  S.W.          Added POLL & documentation

STITLE Port Address Evaluation (PDEV)

**
** Name:(S) PDEV - Evaluate Num Expression as Port Device
** Name: PDEV+ - Evaluate Num Expression as Port Device
** Name: PDEV1 - Evaluate Num Expression as Port Device
**
** Category: FILUTL
**
** Purpose: Evaluates numeric expression for port address
**
** PDEV+ and PDEV entries evaluate an expression
** in memory and ensure it is a valid numeric
** expression.
**
** PDEV1 assumes that the evaluated expression is
** already on the stack. It is useful for functions.
**
** Entry: 3 entry points:
** 1) PDEV+ - D0 2 nibs prior to alleged numeric
** expression.
** 2) PDEV - D0 at alleged numeric expression.
** 3) PDEV1 - D1 points to evaluated expression on
** math stack.
**
** Exit: D(0)=Port extender#; D(1)=port#
** D1 points to numeric expression on stack
** D0 past evaluated numeric expression
** (if entered at PDEV1, D0 unchanged from entry)
** Statuses intact
** (except if entered at PDEV1)
** ERROR EXITS IF EVALUATED EXPRESSION IS INAPPROPRIATE
** FOR A PORT ADDRESS.
**
** Calls: EXPEXC, TST12A, FRAC15, FLTDH, ARGSTA
** CLRFR, GTPRT#, RSTST
**
** Uses: A-D, D1,D0, R0-R3, all of function scratch -- EXPEXC
**
** Detail: Allows numeric expressions which evaluate to x.yy
** where:
** 0<= x <= 5 and 0<= yy <= 15
**
** Stack lvls: 5
**
** History:
**

Date	Programmer	Modification
06/29/82	S.W.	Added documentation
08/05/82	S.W.	Added PDEV1 entry point

**

796      ** Category:  POLL
797      **
798      ** Type:      POLL
799      **
800      ** Purpose:
801      **      POLL for file specification execution
802      **
803      ** Should poll be "Handled" (return with XM=0)?:
804      **      Yes
805      **
806      ** Meaning of "Handling" Poll (what does code do if handled?):
807      **      Returns 1st 8 chars of file name in R
808      **      and last two characters in R0
809      **      D(S)=Device type; D(X)= Device address
810      **
811      ** Entry conditions for handler (registers, ST, RAM, etc.):
812      **      Carry clear
813      **      B[R] = Poll number.

```

```

814      **      HEX mode.
815      **      P=0.
816      **      Low 2 bytes of R0 are blank-filled
817      **      S7=1 => String expression on stack
818      **      Top of stack pointed to by RVMEME
819      **      D0 past string expression
820      **      =0 => Literal
821      **      D0 may be restored from STMTD0 to interpret
822      **      file specifier
823      **
824      ** Normal exit conditions from handler if handled (ST, RAM,
825      ** registers, etc.):
826      **      Carry clear
827      **      HEX mode.
828      **      XM=0.
829      **      A contains file name (blank-filled)
830      **      If > 1 characters, last 1 & 10 in R0
831      **      If no file name specified, A=0
832      **      D(S) = Device type
833      **      D(X) = Device address
834      **      D0 past file specifier
835      **      S7 intact from entry
836      **      If S7 set on entry (string), D1 must point past file
837      **      specifier on stack; eg D1 must reflect new top of stk
838      **
839      ** Normal exit conditions from handler if not handled (ST, RAM,
840      ** registers, etc.):
841      **      Carry clear
842      **      HEX mode.
843      **      XM=1.
844      **
845      ** Error exit conditions from handler:
846      **      Carry set.
847      **      HEX mode.
848      **      C[0-3] = Error number.
849      **

917          STITLE Find File in RAM ROM PORTS
918          ****
919          ****
920          **
921          ** Name:(S) FINDF - Find a file
922          ** Name:(S) FINDF+ - Find a file
923          ** Name: FILEMF - Find a file
924          ** Name:(S) FILEF - Find a file
925          ** Name: FINDWF - Find a file
926          **
927          ** Category: FILUTL
928          **
929          ** Purpose: Searches for a Specified File in file chain(s)
930          ** specified by the caller.
931          **
932          ** The entry points which allow the file chains to
933          ** be specified require as entry conditions some
934          ** of the exit conditions from FILXQ^/FSPECx.
935          **
936          ** FILEF and FILEMF entries search the MAIN file
937          ** chain only.
938          **
939          ** FINDF and FINDF+ entries look at D(S) to
940          ** determine which file chains to search. The only
941          ** difference between the two entry points is that
942          ** FINDF assumes the integrity of D(S) and A(W),
943          ** whereas FINDF+ checks their integrity to ensure
944          ** that A(W) is nonzero and D(S)<=6.
945          **
946          ** FINDWF searches the MAIN file chain for <workfile>
947          **
948          ** Entry: P=0
949          ** 5 entry points:
950          **
951          ** 1) FINDF - file name in A(W)
952          ** D(S) determines search pattern:
953          ** =F => Search MAIN, plug-ins
954          ** =0 => Search MAIN only
955          ** other => Search Plug-ins only
956          ** D(B) indicates port desig.
957          ** =FF => all PORTS (:PORT)
958          ** OR D(1)= PORT #
959          ** D(0)= Extender #
960          **
961          ** 2) FILEF - File name in A(W) - Mainframe search only
962          **
963          ** 3) FILEMF same as above, except file name in B(W)
964          **
965          ** 4) FINDF+ - Same as FINDF.
966          **
967          ** 5) FINDWF - Searches for workfile
968          **
969          ** Exit: P=0
970          ** Carry Clear - File found
971          ** D1 @ File Start

1333          ** Category:    POLL
1334          **
1335          ** Type:        POLL
1336          **

```

```

1337      ## Purpose:
1338      ** Polls to PURGE a file on non-mainframe device
1339      **
1340      ** Should poll be "Handled" (return with XM=0)?:
1341      ** Yes
1342      **
1343      ** Meaning of "Handling" Poll (what does code do if handled?):
1344      ** Purges the file
1345      ** The mainframe will handle purging any associated FIB
1346      **
1347      ** Entry conditions for handler (registers, ST, RAM, etc.):
1348      ** Carry clear
1349      ** B[A] = Poll number.
1350      ** HEX mode.
1351      ** P=0.
1352      ** DO past file specifier
1353      ## D(S) & D(X) contains device info
1354      ## Blank-filled file name in A(W) & R0; R0 contains chars
1355      ** 9 & 10; If no file name given, A=0
1356      **
1357      ** Normal exit conditions from handler if handled (ST, RAM,
1358      ** registers, etc.):
1359      ** Carry clear
1360      ## HEX mode.
1361      ** XM=0.
1362      ** S8=0 (indicates current file was not purged)
1363      **
1364      ** Normal exit conditions from handler if not handled (ST, RAM,
1365      ** registers, etc.):
1366      ** Carry clear
1367      ** HEX mode.
1368      ** XM=1.
1369      **
1370      ** Error exit conditions from handler (POLL only):
1371      ** Carry set.
1372      ** HEX mode.
1373      ** C[0-3] = Error number.
1374      **
1375      ** Available subroutine levels:
1376      ** 7
1377      **
1378      ** NOTE:
1379      ** If not handled, error generated is eFSPEC
1380      **
1381      ** --SCRATCH RAM TO CONSIDER BELOW:--
1382      ** --STMT/FN Scratch, SCRATCH, SNAPBF, TRFMBF, LDCSPC,--
1383      ** --LEXPTR.--
1384      **
1385      ** What registers/RAM may be used if handled?:
1386      ** A-D, DO, D1, P
1387      ** Anything available to statements
1388      ** STMT/FN scratch, R0-R4, S0-S11
1389      **
1390      ** What registers/RAM may be used if not handled?:
1391      ** A-D, DO, D1, P

```

```

1392      **      Same as if handled, except don't use R0 !
1393      **
1394      ** What registers/RAM may be used if error exit:
1395      **      A-D, D0, D1, P
1396      **      Same as if handled
1397      **
1398      ** Special memory/pointer considerations (are pointers funny?):
1399      **      No
1400      **
1401      ** Envisioned application(s):
1402      **      PURGE A:TAPE
1403      **      PURGE :PORT(2) ! PURGE ALL on a plug-in EPROM perhaps
1404      **
1405      ** Note:
1406      **      If not handled, error generated is eFSPEC.

1546 *****
1547 **
1548 ** Name:(S) pPRGPR - Poll to PURGE file on non-RAM device
1549 **
1550 ** Category: POLL
1551 **
1552 ** Type: POLL
1553 **
1554 ** Purpose:
1555 ** Polls for PURGE of file on non-RAM memory device
1556 **
1557 ** Should poll be "Handled" (return with XM=0)?:
1558 ** Yes
1559 **
1560 ** Meaning of "Handling" Poll (what does code do if handled?):
1561 ** Checks File Protection.
1562 ** If current file, ensure there's a workfile in mainframe
1563 ** or room to create one - See Note below.
1564 ** If not secure, purge the file.
1565 ** Call RFAD-I with begin source in R0, offset in B(A)
1566 ** and D1 pointing to S-RO-1 (which contains old enf of
1567 ** file chain)
1568 ** Have S10 set on exit iff a LEX file was purged.
1569 ** S9 should be set on return iff current file purged
1570 **
1571 ** Mainframe will handle:
1572 ** Deleting any associated FIB.
1573 ** If current file purged (S9=1), SUSP annun. will be
1574 ** cleared & new workfile created.
1575 ** If LEX file purged (S10=1), will call LEXBF+
1576 ** If current running file purged, S7 will be set.
1577 **
1578 ** Entry conditions for handler (registers, ST, RAM, etc.):
1579 ** Carry clear
1580 ** B[A] = Poll number.
1581 ** HEX mode.
1582 ** P=0.
1583 ** D1 at file header of file to purge
1584 ** D(S) contains device type
1585 ** 2 => ROM
1586 ** 3 => EPROM
1587 ** D(B) contains port info
1588 **
1589 ** Normal exit conditions from handler if handled (ST, RAM,
1590 ** registers, etc.):
1591 ** Carry clear.
1592 ** HEX mode.
1593 ** XM=0.
1594 ** PCADDR intact
1595 ** S9 set iff current file purged
1596 ** S10 set if LEX file purged
1597 **
1598 ** Normal exit conditions from handler if not handled (ST, RAM,
1599 ** registers, etc.):
1600 ** Carry clear

```

```

1601      **      HEX mode.
1602      **      XM=1.
1603      **
1604      **      Error exit conditions from handler
1605      **      Carry set.
1606      **      HEX mode.
1607      **      C[0-3] = Error number.
1608      **      Possible errors are:
1609      **      eFPROT (file is SECURE)
1610      **      eMEM (file is current, there's no workfile, and no
1611      **              room to create one)
1612      **
1613      **      Available subroutine levels:
1614      **      6
1615      **
1616      **      NOTE:
1617      **      If file to purge is current file, consult mainframe code
1618      **      between PRGF25 & PRGF35 to verify there's a workfile
1619      **      or room to create one.
1620      **
1621      **      --SCRATCH RAM TO CONSIDER BELOW:--
1622      **      --STMT/FN Scratch, SCRATCH, SNAPBF, TRFMBF, LDCSPC,--
1623      **      --LEXPTR.--
1624      **
1625      **      What registers/RAM may be used if handled?:
1626      **      A-D, D0, D1, P
1627      **      R0,R1,R2,R3,S-R0-0,S-R0-1,S0-S7,S9-S11
1628      **
1629      **      What registers/RAM may be used if not handled?:
1630      **      A-D, D0, D1, P
1631      **      Same as if handled (see above)
1632      **
1633      **      What registers/RAM may be used if error exit:
1634      **      A-D, D0, D1, P
1635      **      Same as if handled (see above)
1636      **
1637      **      Special memory/pointer considerations (are pointers funny?):
1638      **      No
1639      **      However, it is important to consider that PURGE of
1640      **      current file CAN and SHOULD generate an insufficient
1641      **      memory error if there's no workfile in the mainframe &
1642      **      no room to create one.
1643      **
1644      **      Envisioned application(s):
1645      **      PURGE A:PORT(2) ! where PORT#2 is an EPROM
1646      **
1647      **      Note:
1648      **      If no one responds, error generated is eFACCS
1649      **
1650      **      History:
1651      **
1652      **      Date      Programmer      Modification
1653      **      -----      -
1654      **      06/29/82    S.W.          Added documentation
1655      **      12/16/82    S.W.          Eliminated check to distinguish

```

```

1656      **                      ROM from other non-RAM devices
1657      ** 12/16/82  S.W.      Poll handler no longer requires
1658      **                      entry point to PRGF40
1659      ** 06/03/83  S.W.      Replaced call to CLSUSP with ZERPGM

1862 *****
1863 *****
1864 **
1865 ** Name:(S) pRNAME - Poll to RENAME file on unknown device
1866 **
1867 ** Category: POLL
1868 **
1869 ** Type: POLL
1870 **
1871 ** Purpose:
1872 ** Polls to RENAME file on external device or on non-RAM
1873 ** memory device.
1874 **
1875 ** Should poll be "Handled" (return with XM=0)?:
1876 ** Yes
1877 **
1878 ** Meaning of "Handling" Poll (what does code do if handled?):
1879 ** Writes out new name to file header (or directory)
1880 ** Should be ready to go on to NXTSTM
1881 **
1882 ** Entry conditions for handler (registers, ST, RAM, etc.):
1883 ** Carry clear
1884 ** B[A] = Poll number.
1885 ** HEX mode.
1886 ** P=0.
1887 ** D0 is past the file specifier
1888 ** Proposed new file name is in the SAVSTK area
1889 ** (or at least what WAS the SAVSTK area before poll)
1890 ** The 10 character blank-filled new file name is 112
1891 ** nibbles LOWER in memory than where SAVSTK points
1892 ** (70 HEX).
1893 **
1894 ** D(S) >= 7 =>
1895 ** RENAME file on external device
1896 ** Name of file to rename is blank-filled in A(W);
1897 ** Characters 9 & 10 in R0
1898 ** D(S),D(X) contain device id
1899 ** In higher memory, adjacent to proposed file name
1900 ** given above, is its corresponding 5 nibble
1901 ** device id (Do a shift right circular to restore
1902 ** to original form).
1903 ** If poll isn't handled, default error is eFSPEC
1904 **
1905 ** D(S) < 7 =>
1906 ** RENAME file on non-RAM memory device
1907 ** D1 is at the file header
1908 ** D(S) contains memory type info
1909 ** 1 => ROM
1910 ** 2 => EPROM
1911 ** D(B) contains port number/extender
1912 ** If poll isn't handled, default error is eFACCS
1913 **
1914 ** Normal exit conditions from handler if handled (ST, RAM,
1915 ** registers, etc.):
1916 ** Carry clear

```

```

1917      **      HEX mode.
1918      **      XM=0.
1919      **      Ready to go on to NXTSTM
1920      **
1921      ** Normal exit conditions from handler if not handled (ST, RAM,
1922      ** registers, etc.):
1923      **      Carry clear
1924      **      HEX mode.
1925      **      XM=1.
1926      **      RO intact from entry.
1927      **
1928      ** Error exit conditions from handler:
1929      **      Carry set.
1930      **      HEX mode.
1931      **      C[0-3] = Error number.
1932      **
1933      ** Available subroutine levels:
1934      **      7
1935      **
1936      ** NOTE:
1937      **      Error if:
1938      **      1) No file name is specified, ie RENAME A TO :TAPE
1939      **          (eFSPEC)
1940      **          (This is default error given if D(S)>=7, else
1941      **              the handler MUST EXPLICITLY error)
1942      **      2) Proposed file name is 'keys'
1943      **          (eFSPEC)
1944      **      3) File by that name already exists on the medium
1945      **          (eFEXST)
1946      **
1947      ** What registers/RAM may be used if handled?:
1948      **      A-D, DO, D1, P
1949      **      RO-R4, SO-S11, STMT/FN scratch
1950      **
1951      ** What registers/RAM may be used if not handled?:
1952      **      A-D, DO, D1, P
1953      **      R1-R3, SO-S11, STMT/FN scratch
1954      **      Don't alter SAVSTK !
1955      **
1956      ** What registers/RAM may be used if error exit:
1957      **      A-D, DO, D1, P
1958      **      RO-R4, SO-S11, STMT/FN scratch
1959      **
1960      ** Special memory/pointer considerations (are pointers funny?):
1961      **      No
1962      **
1963      ** Envisioned application(s):
1964      **      RENAME A:<external device> TO B
1965      **      RENAME A:PORT(3) TO B          (where A is on EPROM)

2569          **
2570          **          EDIT20 collapses all the execution stacks before
2571          **          designating the specified file as current. This
2572          **          is the entry point used by RUN. An assumption is
2573          **          made that this file is of legal type to be made
2574          **          current.
2575          **
2576          ** Entry:   4 entry points:
2577          **          P=0
2578          **          1) EDIT    - DO past tEDIT.
2579          **
2580          **          2) EDITWF - S10=1 => No collapse of stacks and
2581          **                      no CATalog.
2582          **                      S10=0 => No collapse of stacks
2583          **                      CATalog iff S11=0
2584          **
2585          **          3) EDIT80 - S10 and S11 as with EDITWF.
2586          **
2587          **          4) EDIT20 - D1 points at new current file.
2588          **
2589          ** Exit:
2590          **          CURRL UPDATED; Stacks, etc collapsed via CLPSTK
2591          **          Error Exits if:
2592          **          1) file must be created and not enough memory
2593          **          2) specified file is not BASIC
2594          **          3) port# specified that doesn't exist
2595          **          4) non-mainframe device specified
2596          **          If no CATalog is done:
2597          **          B(A)=CURRST; C(A)=D(A)=CURREN;
2598          **          DO points to CURREN RAM location
2599          **

```

```

2600      ** Calls:   CRETF, CLPSTK, FINDF, SAVEL, WRKFIL
2601      **          EOLXCK, FSPECx, POLL, NULLP, BASKEY
2602      **
2603      ** Uses:     A-D, R0-R3, S6, S8, S9, S10, S11, D1, D0
2604      **          + If FSPECx is called: S1, S2, S7, STMTD0,
2605      **            STMTR1 (All of it), All of function scratch
2606      **
2607      ** Detail:   EDIT is a system command (non-programmable). The
2608      **            reason for this limitation is that EDIT changes
2609      **            CURRST & CURREN; this would be nonsensical during a
2610      **            running program, since the same pointers are used
2611      **            to indicate current EDIT file as current RUN file.
2612      **
2613      **          EDIT [filename]

2636      ****
2637      *
2638      ****
2639      ****
2640      **
2641      ** Name:(S) pEDIT - Poll to position at non-BASIC file
2642      **
2643      ** Category:  POLL
2644      **
2645      ** Type:      POLL
2646      **
2647      ** Purpose:
2648      **      Just gives the 'OK' to position at non-BASIC file
2649      **
2650      ** Should poll be "Handled" (return with XM=0)?:
2651      **      Yes
2652      **
2653      ** Meaning of "Handling" Poll (what does code do if handled?):
2654      **      Clears XM

```

```

2655      **
2656      ** Entry conditions for handler (registers, ST, RAM, etc.):
2657      **      B[A] = Poll number.
2658      **      HEX mode.
2659      **      P=0.
2660      **      D1 points at file header
2661      **      A(A) contains file type#
2662      **
2663      ** Normal exit conditions from handler if handled
2664      **      Carry clear (POLL only).
2665      **      HEX mode.
2666      **      XM=0.
2667      **      D1 at file header
2668      **      S11 preserved from entry (flags whether to CATalog)
2669      **      P=0
2670      **
2671      ** Normal exit conditions from handler if not handled (ST, RAM,
2672      ** registers, etc.):
2673      **      Carry clear (POLL only).
2674      **      HEX mode.
2675      **      XM=1.
2676      **      S11 preserved from entry
2677      **      P=0
2678      **
2679      ** Error exit conditions from handler (POLL only):
2680      **      Carry set=> Must be MEMERR
2681      **      HEX mode.
2682      **      C[0-3] = Error number.
2683      **
2684      ** Available subroutine levels:
2685      **      7
2686      **
2687      **
2688      ** NOTE:
2689      **      If handled or not, S11 & D1 must be preserved
2690      **
2691      ** What registers/RAM may be used if handled?:
2692      **      A-D,DO,RO-R3,S6
2693      **
2694      ** What registers/RAM may be used if not handled?:
2695      **      B,C,D,DO,RO-R3,S6
2696      **
2697      ** What registers/RAM may be used if error exit (POLL only)?:
2698      **      N/A
2699      **
2700      ** Special memory/pointer considerations (are pointers funny?):
2701      **      N/A
2702      **
2703      ** Envisioned application(s):
2704      **      To designate non-BASIC file as current, ## cursor keys
2705      **      could be used to 'scroll' through the file contents.
2706      **
2707      **      Also possibly to be used in conjunction with the parse
2708      **      take-over poll, ie position at a non-BASIC file and
2709      **      enter lines.

```

11
12
13 *****
14 *****
15 **
16 ** Name:(S) pVER$ - VER$ Statement Extension Poll
17 **
18 ** Category: POLL
19 **
20 ** Type: FPOLL
21 **
22 ** Purpose:
23 ** Allows a lex file to show its presence and revision
24 ** code.
25 **
26 ** Should poll be "Handled" (return with XM=0)?:
27 ** No!!!
28 **
29 ** Meaning of "Handling" Poll (what does code do if handled?):
30 ** Not applicable
31 **
32 ** Entry conditions for handler (registers, ST, RAM, etc.):
33 ** B[R] = Poll number.
34 ** R2=(AVMEMS)
35 ** R3=Stack pointer
36 ** HEX mode.
37 ** P=0.
38 **
39 ** Normal exit conditions from handler if handled (ST, RAM,
40 ** registers, etc.):
41 ** Not applicable
42 **
43 ** Normal exit conditions from handler if not handled (ST, RAM,
44 ** registers, etc.):
45 ** HEX mode.
46 ** XM=1.
47 ** R2=(AVMEMS)
48 ** R3=New Stack pointer
49 **
50 ** Error exit conditions from handler (POLL only):
51 ** Not applicable
52 **
53 ** Available subroutine levels:
54 ** 2
55 **

```

```

56      ** What registers/RAM may be used if handled?:
57      **      Not applicable.
58      **
59      ** What registers/RAM may be used if not handled?:
60      **      A-C, D[15-5] D0, D1, P
61      **      NOTE: D[A] is sacred in FPOLL!!
62      **      R1 and R4. Function scratch is available in the
63      **      unlikely event it is needed.
64      **
65      ** What registers/RAM may be used if error exit (POLL only?):
66      **      Not applicable
67      **
68      ** Special memory/pointer considerations (are pointers funny?):
69      **      This occurs during expression execute so keep in mind
70      **      the rules of that game.
71      **
72      ** Envisioned application(s):
73      **      The poll handler is expected to add onto the string
74      **      being built on the stack. The stack pointer is kept
75      **      in R3 and must be decremented to point to the new
76      **      end of the string. Available memory should be checked
77      **      by comparing against the AVMEMS (which resides in R2).
78      **
79      **      The string added should have a leading blank followed
80      **      by a short (~3-5 characters) name describing the lex
81      **      file and optionally followed by a colon and a revision
82      **      code. The revision code will usually be just a digit
83      **      but a more complicated code may be required for a
84      **      multi-chip ROM.
85      **
86      ** History:
87      **
88      **      Date      Programmer      Modification
89      **      -----
90      **      06/08/83   B.S.           Added documentation.
91      **
92      **
93      **
94      **
95      **
96      **
97      ** Name:      VER$      - VER$ function
98      **
99      ** Category:   FNEXEC
100     **
101     ** Purpose:
102     **      Implements the VER$ function
103     **
104     ** Entry:
105     **      P      = 0
106     **      D1 points to top of stack
107     **      D0 is program pointer (points past VER$ token)
108     **
109     ** Exit:
110     **      P      = 0

936 **

937 ** Name: CMPLX - Complex Poll

938 ** Name: CMPLXF - Complex Poll

939 ** Name: CMPLXR - Complex Poll

940 ** Name: CPOLL - Complex Poll

941 **

942 ** Category: MTHUTL

943 **

944 ** Purpose: Performs complex math poll.

945 **

946 ** Entry: CMPLX is the Complex conversion function.

947 ** CMPLXF assumes a function token lies left-

948 ** justified in B(X). The token is shifted right.

949 ** C is stored in R3. This is the normal entry

950 ** point for most complex functions which override

951 ** the mainframe functions. This entry point

```

952      **      assumes one of the POP routines was just called.
953      **
954      **      CMPLXR calls CPOLL, then jumps back into the
955      **      expression interpreter. This entry point is
956      **      used by recall operations. A(R) is assumed to
957      **      contain the variable address, with D(S) having
958      **      information about the variable format: even
959      **      for 12-digit, odd for 5-digit.
960      **
961      **      CPOLL does a fast poll to locate the complex
962      **      function Rom code. The function token is in
963      **      C(B). Storage functions have the same entry
964      **      conditions as for CMPLXR.
965      **
966      ** Exit:      CMPLX, CMPLXF, CMPLXR jump back to EXPR.
967      **      CPOLL returns with carry set, or else errors out.
968      **

```

```

1056      **
1057      ** Category:  POLL
1058      **
1059      ** Type:      FPOLL
1060      **
1061      ** Purpose:
1062      **   Look for handler to perform complex operation:
1063      **   Function, Store or Recall.
1064      **
1065      ** Should poll be "Handled" (return with XM=0)?:
1066      **   Yes.
1067      **
1068      ** Meaning of "Handling" Poll (what does code do if handled?):
1069      **   Handler has performed complex operation.  If poll is
1070      **   not handled, calling code errors out (eDATTY).
1071      **
1072      ** Entry conditions for handler (registers, ST, RAM, etc.):
1073      **   Carry set on entry.
1074      **   B[A] = Poll number.
1075      **   HEX mode.
1076      **   P=0.
1077      **   (FUNCD0) contains PC, pointing past token.
1078      **   (FUNCD1) contains 2-nibble token.
1079      **   (AVMEME) contains stack pointer.
1080      **   If token is a function token of one parameter (e.g.,
1081      **       SIN(Z)), then R1 = Real part of argument,
1082      **       R0 = Imaginary part of argument.
1083      **   If token is a function token of two parameters (e.g.,
1084      **       Z*W), then R0 = Imaginary part of argument at top
1085      **       of stack (second argument),
1086      **       R1 = Real part of second argument.
1087      **       R2 = Imaginary part of first argument.
1088      **       R3 = Real part of first argument.
1089      **   If either argument is real, the imaginary part will
1090      **   be represented as 0000000000000900.
1091      **   If token is a comparison token, entry conditions are
1092      **   the same as for other two-parameter functions.  The
1093      **   predicate can be obtained by looking at (PC). (or
1094      **   maybe (PC-1)?)
1095      **   If token is cR->C, it means that a real value is being
1096      **   assigned to a variable whose type is not real, short
1097      **   or integer.  The value to be assigned is at the top
1098      **   of the stack and the variable destination information
1099      **   occupies STMT scratch as set up by DEST routine.
1100      **   If token is cC->C, it means that a value which is
1101      **   neither real or string is being assigned to some
1102      **   variable.  The value to be assigned is at the top of
1103      **   the stack and the variable destination information
1104      **   occupies STMT scratch as set up by DEST routine.
1105      **   If token is cRCL, it means that a complex number needs
1106      **   to be recalled (put on the stack).
1107      **       R1[A] points at the value to be recalled.
1108      **       D[S] is odd iff value is COMPLEX SHORT.
1109      **
1110      ** Normal exit conditions from handler if handled (ST, RAM,

```

```

1111      ** registers, etc.):
1112      **      HEX mode.
1113      **      XM=0.
1114      **      For functions and comparisons, result pushed on
1115      **      math stack (handler must do available memory check
1116      **      and error out if insufficient memory), complete with
1117      **      stack signature. D1 = stack pointer.
1118      **      For store, no further exit conditions.
1119      **      For recall (token = cRCL), value has been pushed on
1120      **      stack, D1 = stack pointer, B[A] = address of
1121      **      variable register, B[S] = E iff COMPLEX, F iff SHORT
1122      **      COMPLEX.
1123      **
1124      ** Normal exit conditions from handler if not handled (ST, RAM,

2111 **
2112 ** Name: STRLIT - Process String Literal Expression
2113 **
2114 ** Category: FNEEXEC
2115 **
2116 ** Purpose:
2117 ** Process a string literal in an expression.
2118 **
2119 ** Entry:
2120 ** DO = PC.
2121 ** D1 = Mathstack pointer.
2122 ** Token in B[B].
2123 ** Jumped on " or ' token.
2124 ** P=0.
2125 **
2126 ** Exit:
2127 ** eMEM if insufficient memory to put string on stack.
2128 ** Through EXPR.
2129 **
2130 ** Calls: None.
2131 **
2132 ** Detail:
2133 ** B[B] contains " or '. This routine scans the string,
2134 ** putting each character on the stack as it is
2135 ** encountered until a matching closing quote is found.
2136 ** The code then builds a string header and exits to
2137 ** expression execution controller.

2295 **
2296 ** Name:      XFN      - Process External Functions
2297 **
2298 ** Category:   FNEEXEC
2299 **
2300 ** Purpose:
2301 **      Process XFNs in expression.
2302 **
2303 ** Entry:
2304 **      P=0.
2305 **      DO = PC.
2306 **      D1 = Mathstack pointer.
2307 **      Jumped on XFN token.
2308 **
2309 ** Exit:
2310 **      Exits to function requested.
2311 **
2312 ** Calls:      XMTADR.
2313 **

```

```

2314      ** Detail:
2315      **      Looks for Xfunction table and then looks for requested
2316      **      entry in table.  If not found then errors with eXFNNF.
2317      **      Otherwise loads address of function execute and jumps
2318      **      to it.
2319      **

**
** Name:(S) ADDONE - Add One
** Name:(S) SUBONE - Subtract One
**
** Category:  MATH
**
** Purpose:

```

```

111      **      To compute X+1 & X-1 for X an internal number.
112      **
113      ** Entry:
114      **      Standard floating point math input with (A,B)=X.
115      **      sINFRD(s10)&sNEGRD(s11), rounding modes, are consulted
116      **      only if X+1=0 (or X-1=0) in which case the result may
117      **      be +0 or -0 depending on the mode.(see AD15s)
118      **
119      ** Exit:
120      **      Standard floating point math output.
121      **
122      ** Calls:      Goes to AD15s .
123      **
124      ** Uses.....
125      **      Inclusive: P; A,B,C,D;
126      **                  HD.ST.[SB];
127      **
128      ** Stk lvls:   0
129      **
130      ** NOTE:
131      **      Can raise no XM=1 xcption . (clrs SB but not XM)

1727      **      HD.ST.[SB,XM];
1728      **
1729      ** Stk lvls:  1
1730      **
1731      ** NOTE:
1732      **      This routine was changed to save code, and now it may
1733      **      occasionally signal inexact (SB=1) when the result is
1734      **      actually exact.
1735      **
1736      **      Signals exact (SB=0) when :
1737      **
1738      **      1) PM15. Since this indicates x/y has less than or
1739      **      equal to 14 digits in its integer part, IP(x/y)
1740      **      will be exact.
1741      **
1742      **      2) x/y is exact. If x/y is exact then it is represented
1743      **      by 15 digits, therefore IP(x/y) will just be some of
1744      **      its leading digits (i.e. exact).
1745      **
1746      **
1747      **      Signals inexact (SB=1) when :
1748      **
1749      **      |x/y| >= 1E14 and x/y is inexact. Unfortunately, x/y
1750      **      can satisfy these conditions and still have IP(x/y)
1751      **      be exact in rare cases.
1752      **
1753      **      Example:
1754      **
1755      **      1E25 div 9999999999 = IP(10000000000100000.0000100..)
1756      **
1757      **      = 1.00000000001E15 exactly, even though |x/y|>1E14
1758      **
1759      **      and x/y is inexact.
1760      **
1761      **

1943 ** Name:(S) uRESNX - User Result (non exceptional)
1944 ** Name:(S) uRESXT - User Result for exact results
1945 **
1946 ** Category: MTHUTL
1947 **
1948 ** Purpose:
1949 ** To pack the 15-form input into a 12-form result for
1950 ** delivery to the user. This includes rounding according
1951 ** to the user's mode, checking for xcpt'ns & consulting
1952 ** relevent trap values, setting the xcptn flags, and sending
1953 ** off any warning messages or errors. The external default
1954 ** result (12 form) is returned in reg C.
1955 **
1956 ** Entry:
1957 ** 1.(A,B)&SB contain x (the unpacked result)
1958 ** 2.XM is set if x is the result of an xcpt (DVZ or IVL)
1959 ** if XM=1 then P=(DZP,IVP or TYPO^0) tells which xcptn and
1960 ** C(A)=msg code (for specific xcptn e.g. 0/0,LOG(0),etc.)
1961 ** **Note**: DZP=3; IVP=4; TYPO^0=14.
1962 **
1963 ** 3.D1=top math stk -- only used for a wrn. msg., to check
1964 ** avail.mem. for a possible mem err.
1965 **

2608 ** Name:(S) MESSG - MESSAGE
2609 **
2610 ** Category: MTHUTL
2611 **
2612 ** Purpose:
2613 ** To display a warning message without disturbing most
2614 ** of the CPU or Math Scratch Stack. It uses available
2615 ** memory instead, to preserve C,R0,R1,R2,R4, D0,D1, Status
2616 ** Bits, Math Scratch (=SCRST0) and RSTK levels.
2617 **
2618 ** Entry:
2619 ** 1) B(A)=msg code; B(W) used if msg has text insertion (see
2620 ** MFURNQ).
2621 ** 2) B(S)= 0 for error
2622 ** = 9 otherwise
2623 ** 3) If B(S)=9 then
2624 ** P=0 ==> no msg (used to suppress msg)
2625 ** P#0 ==> put out warning msg
2626 **
2627 ** 4) D1=top of math stk (end of available memory)
2628 ** -- used only for mem chk when a warning is sent out.
2629 **
2630 **
2631 ** Exit:
2632 ** Displays warn/err msg & rtns to main driver on an err.
2633 **
2634 ** Calls: MFURNQ or exits thru BSERR, CHKmem, SNAPLC,
2635 ** MOVEU3, MOVED3, SNAPR* .
2636 **
2637 ** Uses.....
2638 ** Inclusive: P; A,B,D;R3; (unless an error occurs--BSERR)
2639 ** The Math Scratch Area is saved to Available Memory

```

```

2640      **      since the display routines check Service Request and
2641      **      an Alarm calculation uses math scr.

3414 *****
3415 **
3416 ** Name:(S) EXP15   - EXP(x)      (exponential fcn)
3417 ** Name:(S) EX-115 - EXP(x)-1    (EXPM1(x))
3418 ** Name:(S) DXP100 - EXP for double precision arg
3419 **
3420 ** Category:  MATH
3421 **
3422 ** Purpose:
3423 **      To compute e^x
3424 **
3425 ** Entry:
3426 **      Standard floating point math input.
3427 **      ( Uses s11 to distinguish e^x from [e^x - 1] )
3428 **      DXP100: finite args only; s11=0; R0=low order
3429 **      digits of double precision argument.
3430 **
3431 ** Exit:
3432 **      Standard floating point math output for EXP15.
3433 **      EX-115 outputs e^x in (A,B)&SB and [e^x - 1] in
3434 **      (R1,R0)&SB (SB is the same for both).
3435 **
3436 ** Calls:  DBLSUB,SHFLAC,1/X15S,STAB1,EXAB1,ADDONE,SUBONE
3437 **      and other local subroutines.
3438 **
3439 ** Uses.....
3440 **      Inclusive: P; A,B,C,D; R regs [0]; ST.[10,11];
3441 **      HD.ST.[SB,XM];
3442 **      EX-115 also uses R1.
3443 **
3444 **
3445 ** Stk lvls:  1
3446 **
3447 ** NOTE:
3448 **      When xpon(e^x)>19999 then EXP15(x):=9.99...99E+19999 .

```

```
3449      **      When      "      < -19999 then EXP15(x):=9.9..99E-19999 .

** Name:(S) LGT15 - Log base 10

**

** Category: MATH

**

** Purpose:

** To compute the base 10 logarithm of x.

**

** Entry:

```

3800
3801
3802
3803
3804
3805
3806
3807
3808

```

```

3809      **      Standard floating point math input.
3810      **
3811      ** Exit:
3812      **      Standard floating point math output.
3813      **
3814      ** Calls:      NRMLAB, EX15, LN15, LNC10+, DV15S, MAKE1
3815      **
3816      ** Uses.....
3817      ** Inclusive: P; A,B,C,D; R regs [0]; ST.[10];
3818      **              HD.ST.[SB,XM];
3819      **
3820      ** Stk lvls:   2
3821      **
3822      ** NOTE:
3823      **      LGT(10^n) returns n exactly.
3824      **

MSG: "EXPONENT(0)"
Answer = -INF, raise DVZ

Neg Exponent?
If Not negative, Go EXLOOP.

Rotate digit to MANT
Bump exponent
Done?
No.

Shift MANT past sign field
Adjust exponent
Exact result.

```

```

11 *****
12 *****
13 *****
14 **
15 ** Name: CLKSPD - Compute CPU Clockspeed
16 **
17 ** Category: GENUTL
18 **
19 ** Purpose:
20 ** Determine CPU clock speed for use in time-dependent
21 ** applications.
22 **
23 ** Entry:
24 ** None
25 **
26 ** Exit:
27 ** Clockspeed/16 in HEX stored in CSPEED.
28 ** P=0.
29 ** Carry clear.
30 ** INTON.
31 ** HEX mode.
32 **
33 ** Calls: None
34 **
35 ** Uses.....
36 ** A,B,C[A],D0,P
37 **
38 ** Stk lvls: 0
39 **
40 ** Detail:
41 ** Clockspeed is accurate to about 500 hz.
42 **
43 ** Algorithm:
44 ** Look at nibble 1 of display driver timer.
45 ** Loop until kerchunk (1/512 sec time boundary).
46 ** (Since we determine kerchunk by looking at low nib
47 ** only, kerchunk could not have occurred in middle
48 ** of this read.)
49 ** Execute 36-cycle counting loop for 32 kerchunks.
50 ** (1/16 seconds).
51 ** Screen for false alarm (e.g., looking for 10H and
52 ** having timer kerchunk between reading nibs of
53 ** 20H, resulting in misreading as 10H rather than 1FH).
54 ** Compute clockspeed/16 as:
55 ** 36*[loop counter] - 19.

```

```
56      **
57      ** History:
58      **
59      **      Date      Programmer      Modification
60      **      -----      -
61      **      05/19/82      NM      Added documentation
62      **      02/23/83      NM      Smpl int to 1/16; write to CSPEED

334 **
335 ** Name:    DYNAMIC - Variable Recall
336 ** Name:    STATIC - Variable Recall
337 ** Name:(S) RECALL - Variable Recall
338 **
339 ** Category:  VARNGT
340 **
341 ** Purpose:
342 **     Recall a variable.
343 **     Also set up destination address information for
344 **     possible use by DEST after expression execution
345 **     terminates.
346 **
347 ** Entry:
348 **     P=0.
349 **     HEX mode.
350 **     STATIC: Expression execution controller jumped on variable
351 **               token (non-alpha-digit).
352 **               DO=PC.
353 **               D1=top of stack.
354 **     DYNAMIC: Expression execution controller jumped on alpha-
355 **               digit variable token.
356 **               DO=PC.
357 **               D1=top of stack.
358 **     RECALL: DO=PC.
359 **               A[A]=top of stack.
360 **               DO,B[A]=address of variable register (register
361 **               contains variable if simple, else contains
362 **               dope vector).
363 **
364 ** Exit:
365 **     Through FNRTN2.
366 **     DO=PC, pointing past expression.
367 **     D1=stack pointer.
368 **     Value recalled in on top of stack.
369 **
370 ** Calls:
371 **     If we are end of expression (this recall is last thing
372 **     done): ADRS10, ADRS40, MOVED3, READIN, RECADR.
373 **     If we are not at end of expression, control reverts
374 **     to expression execution controller, which could call
375 **     anything.
376 **
377 ** Uses.....
378 **     If we are not at end of expression: everything
379 **     available to expression execution controller.
380 **     If we are at end of expression: A-D,DO,D1,P.

```

```

381      **
382      ** Stk lvls:  1
383      **           2, if we are at end of expression.
384      **
385      ** NOTE:
386      **       This is part of expression execution. It does not
387      **       return, it goes back to the expression execution
388      **       controller. The way to use this routine is to set
389      **       up the tokenized form of the variable you want to
390      **       access (whether for recall or for computing the store
391      **       address), complete with a terminator, point DO at it
392      **       and perform an expression execute. You can, with some
393      **       cleverness, set things up to look as though an
394      **       expression execution is in progress and call this code
395      **       instead of calling EXPEXC. This might save a little
396      **       execution time.
397      **
398      ** Detail:
399      **       In addition to recalling the variable, this routine
400      **       sets up information relevant to using the variable as a
401      **       destination. This information includes the variable
402      **       address, substring parameters, type, array register
403      **       number, maximum string length and subscript count.
404      **       If this is the last thing done before the expression
405      **       terminates, that information is intact upon return from
406      **       the expression execution controller, and can be passed
407      **       to the DEST subroutine for storage somewhere safe.
408      **
409      **       WHY? One purpose of this code is to evaluate a
410      **       variable on the left side of an assignment operator (=)
411      **       so it can be stored into after the expression on the
412      **       right side is evaluated. DEST serves the purpose of
413      **       saving the destination information so the assignment
414      **       can take place later.
415      **
416      **       The destination information is stored in function
417      **       scratch and B[W]. DEST moves it to statement scratch.
418      **

322 *****
323 *****
324 **
325 ** Name:(S) DEST    -   Save Variable Destination Info
326 **
327 ** Category:   VARMG
328 **
329 ** Purpose:
330 **   Save variable destination information for use by STORE
331 **   subroutine.
332 **
333 ** Entry:
334 **   B           = Exit condition from EXPEXC (see note below)
335 **   D1          = Exit condition from EXPEXC (see note below)
336 **   F-R1-0     = Exit condition from EXPEXC (see note below)
337 **   F-R1-3     = Exit condition from EXPEXC (see note below)
338 **
339 ** Exit:
340 **   P=0.
341 **   Following information has been stored:
342 **     S-R0-1 = First substring parameter.
343 **     S-R0-2 = Second substring parameter.
344 **     S-R0-3 = Variable type.
345 **     S-R1-0 = Array element number.
346 **     S-R1-1 = Maximum string length.
347 **     S-R1-3 = Subscript count.
348 **
349 ** Calls:      None.
350 **
351 ** Uses.....
352 **           D1,C.
353 **
354 ** Stk lvs:   0
355 **
356 ** NOTE:
357 **   Whenever EXPEXC evaluates a variable (simple or array
358 **   element), it leaves destination information about that
359 **   variable in B[W] and function scratch. This routine
360 **   puts that information in statement scratch, where it is
361 **   safe from further abuse during expression execute, and
362 **   can be subsequently accessed for a store operation.
363 **
364 **   In computing the destination information, the recall
365 **   code sets up information about the variable's address,
366 **   substring parameters, type, array register number,
367 **   maximum string length and subscript count. If the
368 **   variable does not exist, that fact is somehow encoded
369 **   into this information and the variable will be created
370 **   in the store subroutine.
371 **
372 ** Detail:
373 **   Typically called after EXPEXC, which left information
374 **   around about the location of the last variable
375 **   evaluated (if evaluating a variable was the last thing

```

```

376      **      done). Typical use is in variable assignment:
377      **      EXPEXC (evaluate destination variable).
378      **      DEST (save destination information for STORE).
379      **      EXPEXC (evaluate expression).
380      **      STORE (store result in destination variable).
381      **
382      ** History:
383      **
384      **      Date      Programmer      Modification

67      ****
68      **
69      ** Name:   TRACER - Trace variable assignment
70      **
71      ** Category:  VARMT
72      **
73      ** Purpose:  Trace variable assignment
74      **
75      ** Entry:
76      **      S13 = System run flag
77      **      S-R1-2 = Address of the variable token in the statement.
78      **      S-R1-2 = 0 to disable the TRACE VARS for one assignment.
79      **      STMTRO & STMTRI have not been altered since last time
80      **      called the DEST. STMTRO & STMTRI have the information
81      **      of the destination, such as variable type, array
82      **      subscript, etc.
83      **
84      ** Exit:
85      **      This routine is called by the STORE routine, so it
86      **      return to STORE thru a hardwire jump to =TRCRTN.
87      **
88      **
89      ** Calls:  EXPRDC, DRANGE, ADRS45, TRCLIN, DSBFCK, HEXDEC, LIN#AU
90      **          STR$SB, DSPCNA, POPMTH, AVE=D1, REVPOP, TRFM20, FNCK
91      **          DO=PCA, RCLNUM, D=AVME, DO=AVS, OUT2TC, D1=SR1
92      **          VARDC, IDIV, D1=TRC, BSTYCK, FCALC?, DATLEN.
93      **
94      ** Uses:   A-D, DO,D1, R0,R1,R2, S0,S3,S5,S8-11
95      **
96      ** Stk lvls:  4
97      **
98      **
99      ** Note: TRACER can't destroy R3. STORE passes the value stored
100     **      in the variable in R3 - this is needed by NEXT
101     **
102     ** Detail:
103     **      This routine is only called by the STORE routine, so the
104     **      only way to trace an assignment is to go through STORE.
105     **      The reason we need the address of the variable token in
106     **      the statement is that the destination variable name will
107     **      be reconstructed by decompiling the variable token.
108     **      If the destination is a substring or array element, the
109     **      subscript(s) will be computed from the information stored
110     **      in the STMTRO & STMTRI.
111     **      If in a case the address of the variable token or the
112     **      content of STMTRO & STMTRI are lost, just zero the S-R1-2
113     **      to disable the tracing temporally.
114     **

536      **      Name:(S) pCURSR - Cursor Key with non BASIC file Poll

```

```

537      **
538      ** Category:  POLL
539      **
540      ** Type:      FPOLL
541      **
542      ** Purpose:
543      **   Fast Poll to allow the Cursor Keys to be used with
544      **   non BASIC files:
545      **   Cursor Up, Cursor Down, Cursor Top, Cursor Bottom
546      **
547      ** Should poll be "Handled" (return with XM=0)?:
548      **   No this is a TAKE OVER poll
549      **
550      ** Meaning of "Handling" Poll (what does code do if handled?):
551      **   Perform Cursor Key on file, return to MAIN30/MAINLP
552      **   See notes below.
553      **
554      ** Entry conditions for handler:
555      **   Carry set
556      **   B[A] = Poll number = pCURSR
557      **   HEX mode.
558      **   P=0.
559      **
560      **   Type of Key:      Status: sCURUP (S2)  sCURBT (S3)
561      **   -----
562      **   Cursor Bottom          0              1
563      **   Cursor Top            1              0
564      **   Cursor Up             1              1
565      **   Cursor Down           0              0
566      **
567      **   Call RDCHD+ to get Filetype returned in R2
568      **
569      ** Normal exit conditions from handler if handled (ST, RAM,
570      ** registers, etc.):
571      **
572      **   HEX mode
573      **   Perform Cursor Key on file
574      **   GOVLNG to MAIN30
575      **
576      ** Normal exit conditions from handler if not handled (ST, RAM,
577      ** registers, etc.):
578      **   HEX mode.
579      **   XM=1.
580      **   S2 and S3 must be preserved
581      **
582      ** Available subroutine levels: 5
583      **   FPOLL handler is two levels deeper than caller
584      **   Invoked from CURSOR keys --- top level
585      **
586      ** NOTE:
587      **   The file type of the current file can be determined:
588      **   Call RDCHD+; R2 = File type on return
589      **
590      ** What registers/RAM may be used if handled?:
591      **   A-D, D0, D1, P always available--

```

```

592      **      Anything may be used: Status,R0-R4, SCRATCH...
593      **      CURRL (4 nibs) holds the current BASIC file line number
594      **      This field may be used if CURRENT file is line numbered
595      **
596      ** What registers/RAM may be used if not handled?:
597      **      A-C, D[15-5] D0, D1, P always available
598      **      NOTE: D[A] is sacred in FPOLL!--
599      **      R0-R4
600      **
601      ** Special memory/pointer considerations (are pointers funny?):
602      **      Take care when returning to the MAIN LOOP
603      **
604      **      MAIN30 is the return point for Cursor Keys in BASIC
605      **      The line has been decompiled
606      **      The prompt is sent and the display built (BLDDSP)
607      **      MAINLP is the return point if NOTHING is displayed
608      **      CR/LF with no delay has been sent (S-CRLF) prior
609      **      to displaying the line.
610      **
611      **
612      ** Envisioned application(s):
613      **      Allow Cursor keys to display lines of a non BASIC file
614      **
615      **      The handler is responsible for maintaining the
616      **      "Current file" position. Possibly an I/O Buffer can
617      **      be used.
618      **
619      ** History:
620      **
621      **      Date      Programmer      Modification
622      **      -----
623      **      03/01/83   JP              Added poll
624      **      04/14/83   JP              Revised documentation
625      **      06/02/83   SW              If null file, check for AUTO mode;
626      **                                  Not AUTO mode => goto MAINLP
627      **                                  AUTO mode => display curr line
628      **                                  (Before, went to MAINLP regardless)

91          STITLE Hardware Configuration code
92          *****
93          *****
94          **
95          ** Name:(S) CONF      -   Configure Everything
96          **
97          ** Category:   CONFIG
98          **
99          ** Purpose:
100         **      To configure all soft-configurable devices on the
101         **      system bus.
102         **
103         ** Entry:
104         **      CONF: S0=0 if requesting a power-up configuration
105         **      (preserve integrity of system),
106         **      1 if requesting a coldstart configuration (reset
107         **      all pointers to coldstart values).
108         **      CONFS3: S0 as above plus:
109         **      S3 = 1 if we intentionally want configuration to
110         **      behave as though ROM configuration changed.
111         **
112         ** Exit:
113         **      Configuration proper falls through to LEXBUF. S0
114         **      indicates whether a power-up configuration (S0=0) or
115         **      a coldstart configuration (S0=1) was done.
116         **
117         ** Calls:      AD1P,C=MAIN,C=RAME,CDIV10,CLKSPD,CLRXDS,
118         **              CONFP4,CSLC3,CSLW4,CSLW5,CSRC3,CSRW3,
119         **              D=AVME,DSLW-P,FNDBUB,INITPT,MODSIZ,MOVED2,
120         **              MOVEUA,MOVED3,MRKNEW,MRKOLD,MSIZE,Moveu3,
121         **              R3<RST,RFADJ+,ROMTPT,RST<R3,SIZE10, SORT,
122         **              SORTP2,STMBF?,TBLPT+,TBLPTR,UNCFG8,WAITKY,
123         **              WHLTBL,csrw6.
124         **
125         ** Uses.....
126         **              A,B,C,D,DO,D1,P,R0-R4,Display buffer,S0-S3,
127         **              RSTKBF.
128         **
129         ** Stk lvls:   3 (four are saved in RSTKBF)
130         **
131         ** NOTE:
132         **      The configuration code may decide on its own to perform
133         **      a coldstart configuration when a power-up config was
134         **      requested. This would be done if certain memory was
135         **      corrupt, disallowing the manipulations necessary to
136         **      maintain system integrity. In this case, the code
137         **      will GOVLNG to COLDST (address #00000), which will
138         **      wipe out the machine and call this code with S0=1.
139         **
140         **      If configuration code determines that ROM configuration
141         **      has changed to a point endangering the validity of
142         **      the umpteen pointers in the mainframe, it will
143         **      essentially perform an "EDIT workfile" before falling
144         **      into the LEXBUF code. It will also close all files
145         **      in the FIB. This may be forced by entering at CONFS3

```

```
146      **      with S3=1.
147      **
148      **      If code detects the presence of too many ROMs to
149      **      configure in the address space, it will give a warning
150      **      message. It is not written to cover the contingency
151      **      of too many RAMS or MMI/O devices, on the assumption
152      **      that the possibility of said happening is too small
153      **      to merit the immense code required.
154      **
155      ** Detail:
156      **
157      ** This code configures all soft-configurable devices on the
158      ** system Bus. The code builds three tables in the configu-
159      ** ration buffers: System RAM, Other memory (ROM, EEPROM,
160      ** independent RAM, etc.), Memory-mapped I/O. The buffer IDs
161      ** for the above configuration tables are, respectively,
162      ** FF, FE, FD. The exact format of the information in the
163      ** tables is explained below.
164      **
165      **
166      ** Following is the pre-configuration memory layout:
167      **
168      ** 00000-1FFFF: Operating system
169      ** 2C000-2C01F: Card reader
170      ** 2E100-2E3FF: Display RAM
171      ** 2F400-2FFFF: Disp Driver RAM
172      ** (FFC00-FFFFF: Reserved for config garbage collection)
173      **
174      ** The configuration code assigns addresses as follows:
175      **
176      ** Memory-mapped I/O upward from 20000-28000.
177      **
178      ** System RAM contiguously upward from 30000.
179      ** To achieve this contiguous mapping, system RAM is
180      ** configured in reverse size order. This assures that
181      ** 64 Knib RAMS are configured on 64 Knib boundaries,
182      ** 32 Knib RAMS on 32 Knib boundaries, etc.
183      **
184      ** Uses S0-S3 internally as follows:
185      ** S0: Set for coldstart, clear for power-up configure.
186      ** S1: Used internally in debubbling system RAM, then
187      **      used to indicate presence of ROMs for which
188      **      there is no room to configure. Results in
189      **      message.
190      **      (Debubbling is explained in algorithm (below)
191      **      shortly below CON400 label.)
192      ** S2: Set to indicate failure of internal file chain
193      **      verify. Results in message.
194      ** S3: Set to indicate that system ROM configuration has
195      **      changed to an extent which may endanger the
196      **      validity of some pointers. Results in collapsing
197      **      of stacks and resetting pointers as though an
198      **      "edit" command was entered.
199      **
200      ** To explain configuration, the following terms are used
```

```

201    ** below:
202    **
203    **     PORT#: Physical port location (1-5) whose daisy chain
204    **             is addressed by a bit (0-4) in output register.
205    **             Port #0 is the internal daisy chain.
206    **             Port #5 goes to the card reader slot.
207    **     DEV#: Position of a plug-in (0-15) in a daisy chain.
208    **             Unless there is a port extender, all plug-ins
209    **             will be device #0.
210    **     SEQUENCE: Consecutive chips in a module to be used
211    **                 as a single entity (e.g., a quad RAM which
212    **                 appears as one plug-in to the user).
213    **     DEVICE TYPE: Type of memory (RAM, ROM, etc., or memory-
214    **                 mapped I/O).
215    **     DEVICE CLASS: Identifies memory-mapped I/O device.
216    **
217    **
218    ** *** CHIP ID ***
219    **
220    **     The CHIP ID is a (usually) mask-programmed 20-bit pattern
221    **     which is read by the CPU on an ID poll (C=ID instruction).
222    **     A chip responds to the ID poll if two conditions are met:
223    **         1) The chip is unconfigured,
224    **         2) Daisy-in is high on the chip.
225    **     By examining the daisy chains one at a time, configuring
226    **     each chip as we find it, we can locate and identify all
227    **     soft-configurable chips on the bus.
228    **
229    ** The chip-id contains the following information:
230    **
231    **     NIBBLE 0: 15-Log2(size).
232    **
233    **         Memory Size          Nib 0          MM I/O space
234    **         -----          -
235    **         1 knob             F             1 word (16 nibs)
236    **         2                  E             2
237    **         4                  D             4
238    **         8                  C             8
239    **         16                 B             16
240    **         32                 A             32
241    **         64 (max RAM)       9             64
242    **         128                8             128
243    **         256 (max memory)  7             256
244    **                          6             512
245    **                          5             1024
246    **
247    **     NIBBLE 1: (Reserved for future use)
248    **             This nibble from the first chip in a
249    **             sequence is stored in the configuration
250    **             table for all sequences.
251    **
252    **     NIBBLE 2: Device type-- 0: RAM
253    **                          1: ROM
254    **                          2-E: assorted memory types
255    **                          F: Memory-mapped I/O

```

```

256      ** NIBBLE 3: For memory, (unassigned).
257      ** For memory-mapped I/O, contains device
258      ** class-- 0: HPIL mailbox
259      ** 1-15: (unassigned)
260      ** (Note: Card reader is hard configured
261      ** at 2C000-2C01F.)
262      **
263      ** NIBBLE 4: bits 0-1: (unassigned)
264      ** bit 2: Last chip in sequence (see note (1)
265      ** below).
266      ** Always assumed high for MM I/O
267      ** devices, meaning all such devices
268      ** have their own table entry.
269      ** bit 3: Last chip in module.
270      **
271      ** The top two bits (bits 2-3 of nibble 4) are used to
272      ** determine what chips are in what physical plug-ins.
273      ** Every sequence of chips (e.g., four identical RAMS in
274      ** a RAM plug-in, an applications pack containing two
275      ** ROMS, etc.) results in one entry in the configuration
276      ** tables.
277      **
278      ** (1) End of sequence (but not module) is identified in
279      ** one of two ways: 1) next chip returns ID with different
280      ** value in nibs 0-3; 2) last chip of sequence has bit
281      ** 18 set. The second approach is necessary if
282      ** consecutive, identical chips are to be considered as
283      ** different sequences, and will probably NEVER be used
284      ** in the entire lifetime of the machine. But it can
285      ** be done.
286      **
287      ** ■ module containing four 8-Kbit RAMS might return the
288      ** following sequence of IDs:
289      ** 0000E 0000E 0000E 8000E
290      ** The resulting table entry would identify the chip
291      ** size, chip count, device type, physical location,
292      ** and configuration address of the device.
293      **
294      ** ■ module containing two 128-Kbit ROMS, a memory-mapped
295      ** I/O interface using 2 words of address space, and four
296      ** 16-Kbit RAMS might present the following sequence of
297      ** IDs:
298      ** 0010A First ROM \ one ROMtable entry
299      ** 0010A End of ROM sequence /
300      ** 01F0E MM I/O devclass 1 one MM I/Otable entry
301      ** 0000D Start of RAMS \
302      ** 0000D | one RAMtable entry
303      ** 0000D |
304      ** 8000D End of module /
305      **
306      ** Restrictions: 16 chips/sequence
307      ** 16 sequences/device
308      ** 16 devices/port
309      **
310      **

```

```

524      **      If more newtable entries goto CON330.
525      **      CON370: {remaining oldtable entries missing}
526      **      Mark oldtable entry as missing.
527      **      CON380:
528      **      Any more oldtable entries? If yes then goto CON370
529      **      else goto CON400.
530      **      CON390: {remaining newtable entries new}

```

```

531      **      Mark newtable entry as missing.
532      **      Any more entries? If yes then goto CON390.
533      **      CON400:
534      **      Read current values of AVMEMS and AVMEME. Look at
535      **      oldtable. If any entries are marked as missing and
536      **      were not entirely contained between AVMEMS and AVMEME
537      **      then goto coldst.
538      **      Compute new AVMEME. Store in R3.
539      **      {Now comes the really hard part. We will rearrange
540      **      everything in memory to restore contiguity in light
541      **      of any system RAMs which were added.}
542      **      Sort RAMtable by address.
543      **      Point past last entry in RAM table {we will read
544      **      back from end of table}.
545      **      {This is a debubbling process; that is, removing
546      **      "bubbles" of new memory from existing memory. This
547      **      is done by creating a zero-length bubble at RAMEND.
548      **      The bubble is then moved down through memory, passing
549      **      RAMs which are not marked as new and expanding to
550      **      contain RAMs which are marked as new. This process
551      **      continues until the bubble hits available memory,
552      **      which is itself a bubble.}
553      **      DO=new RAMEND {lowbound of bubble}.
554      **      R3=new RAMEND {highbound of bubble}.
555      **      D=old AVMEME {to know when we are done}.
556      **      S1=0 {indicate that we are not almost done}.
557      **      CON470:
558      **      Any more table entries? If yes then goto CON480.
559      **      Dope up entry to look like built-in hard-configured
560      **      RAM.
561      **      S1=1 {indicate we are almost done}.
562      **      Goto CON490.
563      **      CON480:
564      **      Read next table entry down.
565      **      Marked as new? If not then goto CON490.
566      **      DO=DO-modulesize {expand bubble by changing lowbound}.
567      **      Goto CON470.
568      **      CON490:
569      **      If bubblesize#0 then goto CON500.
570      **      DO=DO-modulesize {move lowerbound of bubble}.
571      **      R3=R3-modulesize {move upperbound of bubble}.
572      **      If S1=1 {i.e., if we are almost done} then goto CON550
573      **      else goto CON470.
574      **      CON500:
575      **      Move bubble down (i.e., move data up) size of module.
576      **      If there is nothing to move (i.e., we have hit
577      **      available memory) then goto CON550.
578      **      If S1=0 goto CON470.
579      **      CON550:
580      **      {now that we have debubbled the stacks, it is time to
581      **      debubble program memory.}
582      **      R3=30000H {lowbound of bubble}.
583      **      DO=30000H {highbound of bubble}.
584      **      D=AVMEMS {to determine when we are done}.
585      **      CON560: {start of loop}

```

```

586      **      Any more table entries? If not then goto CON650.
587      **      Read next entry. If not marked as new then goto
588      **      CON580.
589      **      Increase upperbound of bubble (DO) by size of this
590      **      module.
591      **      Goto CON560.
592      **      CON580:
593      **      Move bubble down past this module (i.e., move that
594      **      amount of data down--to lower memory).
595      **      If we are not done (bubble has not hit available
596      **      memory) then goto CON560.
597      **      CON650:
598      **      Unmark all RAMtable entries which were marked as new.
599      **      Update all pointers past AVMEME {since available memory
600      **      may have changed size}.
601      **      Update variable chain heads.
602      **      Sort RAMtable in port-dev# order {since this will be
603      **      the oldtable next time, it needs to be in this
604      **      order}.
605      **      Sort ROMtable in port-dev# order.
606      **      Look for old ROMtable. If not found then goto coldst.
607      **      Compare old and new ROMtables. If any old ROMs are
608      **      missing or moved then S3=1 {indicate that we wish to
609      **      force an edit-workfile to occur}.
610      **      PUTBUF:
611      **      Sort Memory-mapped I/O table by port-dev#.
612      **      Delete all table entries in all tables with an assigned
613      **      address of FFF00 {these were not configured}. If any
614      **      entries deleted, S1=1 {indicate that configuration
615      **      error has occurred}.
616      **      {Now we will move tables from display buffer, where
617      **      they were built, to configuration buffer area, where
618      **      they will live, and will be known as oldtables on the
619      **      next configuration.}
620      **      Compute size needed for configuration tables. Compute
621      **      size taken by current configuration tables. Compute
622      **      difference and move memory to make proper amount of
623      **      room.
624      **      If there is insufficient memory to hold new tables,
625      **      pinch off tables one entry at a time until there is
626      **      room and indicate configuration error {S1=1}.
627      **      Move tables from display buffer to configuration buffer
628      **      area.
629      **      Compute clockspeed and store in RAM (gosbvl CLKSPD).
630      **      Restore subroutine levels saved at beginning.
631      **      Fall through to LXBF++.
632      **      { Configuration proper is done. The LXBF code will
633      **      find and build tables of all lexfiles. It will also
634      **      report configuration error if that was requested
635      **      and perform an edit-workfile if that was requested.
636      **      That could not be done at this point in the code
637      **      because some polls are issued, and that cannot be
638      **      done until we have a valid list of lexfiles.}
639      **

1324
1325 * Sort whole table by devtype.
1326 * Since address is secondary sort key and IRAMs have been
1327 * assigned rubbish addresses, they will appear after
1328 * RAMs (conveniently falling in the ROM table).
1329 * Since size is tertiary sort key, each device type will
1330 * be sorted by size. This is useful for RAMs and MMIO.
1331 * Since ROMs encompass several device types, a subsequent
1332 * sort by size will be needed.

2600      *****
2601      *****
2602      **
2603      ** Name:(S) pCONFIG - Configuration Poll
2604      **
2605      ** Category:  POLL
2606      **
2607      ** Type:      FPOLL
2608      **
2609      ** Purpose:
2610      **      Poll at termination of configuration to allow:
2611      **          1) Claiming of I/O buffers.
2612      **          2) Changing configuration of machine.
2613      **
2614      ** Should poll be "Handled" (return with XM=0)?:
2615      **      Yes, but ONLY IF reconfiguration is desired.
2616      **
2617      ** Meaning of "Handling" Poll (what does code do if handled?):
2618      **      Calling code jumps to beginning of configuration code
2619      **      and reconfigures the system.
2620      **
2621      ** Entry conditions for handler (registers, ST, RAM, etc.):
2622      **      Carry set.
2623      **      B[A] = Poll number.
2624      **      HEX mode.
2625      **      P=0.
2626      **
2627      ** Normal exit conditions from handler if handled (ST, RAM,
2628      ** registers, etc.):
2629      **      HEX mode.
2630      **      XM=0.
2631      **
2632      ** Normal exit conditions from handler if not handled (ST, RAM,
2633      ** registers, etc.):

```

```
2634      **      HEX mode.
2635      **      XM=1.
2636      **
2637      ** Available subroutine levels:
2638      **      --FPOLL handler is two levels deeper than caller--
2639      **      LEXBUF (from where pCONF is invoked) saves 3 stack
2640      **      levels. A responder may use UP TO 3 levels
2641      **
2642      ** NOTE:
2643      **      "Handling" the poll (returning with XM=0) is very
2644      **      serious business. It means that you want the machine
2645      **      reconfigured. Lazy writers of poll handlers who fail
2646      **      to RTNSXM when they should can hang the machine in
2647      **      CONFIGURATION forever.
2648      **
2649      **      --SCRATCH RAM TO CONSIDER BELOW:--
2650      **      --STMT/FN Scratch, SCRATCH, SNAPBF, TRFMBF, LDCSPC,--
2651      **      --LEXPTR.--
2652      **
2653      ** What registers/RAM may be used if handled?:
2654      **      All CPU registers.
2655      **      All scratch RAM (I think).
2656      **
2657      ** What registers/RAM may be used if not handled?:
2658      **      All CPU registers except D[A].
2659      **      All scratch RAM (I think).
2660      **
2661      ** Special memory/pointer considerations (are pointers funny?):
2662      **      May be in CALC mode.
2663      **
2664      ** Envisioned application(s):
2665      **      Three main ones: 1) claiming I/O buffers, 2) creating
2666      **      I/O buffers, and 3) changing configuration.
2667      **
2668      **      1) Claiming: This is the time to reclaim I/O buffers to
2669      **      keep them from being deleted. Just before this
2670      **      poll, all I/O buffers are marked for deletion. To
2671      **      keep your I/O buffers from being deleted, you need
2672      **      to perform an I/ORES on those you want to keep.
2673      **      [Marking/unmarking for deletion consists of
2674      **      clearing/setting (respectively) the upper bit of
2675      **      the buffer ID number. Until the buffer is restored
2676      **      (unmarked), it will not be found with I/OFND
2677      **      because it will have a different number.]
2678      **
2679      **      2) Creating: This may be the time to create needed
2680      **      I/O buffers. Or you may have done it at wakeup
2681      **      time. Or maybe some other time. But maybe here.
2682      **
2683      **      3) Changing: There are certain ways software can change
2684      **      the configuration of the machine; specifically by
2685      **      doing FREE or CLAIM port. Sample situation: a
2686      **      plug-in may contain a ROM with RAM intended only
2687      **      for the ROM's use. When polled at configuration
2688      **      time, the ROM examines the RAM table and determines
```

2689 ** that the RAM living in the same plug-in is
 2690 ** configured as system RAM. The ROM then performs all
 2691 ** the trappings of FREEPORT except the configuration.
 2692 ** It then indicates that the poll has been handled,
 2693 ** and the code reconfigures the system. When this
 2694 ** poll happens again (as it inevitably will), the ROM
 2695 ** will see that its companion RAM is configured as
 2696 ** IRAM, and will not repeat this monkey business.
 2697 **

59          ** Name:(S) pFTYPE - Search for file type table entry
60          **
61          ** Category:   POLL
62          **
63          ** Type:       POLL
64          **
65          ** Purpose:
66          **   Search file type table in LEX file for a given file type
67          **   number.
68          **
69          ** Should poll be "Handled" (return with XM=0)? :Yes

```

```

70      **
71      ** Meaning of "Handling" Poll (what does code do if handled?):
72      **     Returns with D1 pointing to the file type table entry
73      **     that contains the file type.
74      **
75      ** Entry conditions for handler (registers, ST, RAM, etc.):
76      **     B[A] = Poll number.
77      **     HEX mode.
78      **     P=0.
79      **     A[A] = file type
80      **
81      ** Normal exit conditions from handler if handled (ST, RAM,
82      ** registers, etc.):
83      **     Carry clear
84      **     HEX mode.
85      **     XM=0.
86      **     D1 pts to start of the file type entry in the table
87      **     A(S) = Position of file type number within entry
88      **             (1 = first file type, etc.)
89      **     A[A] = As entry condition
90      **
91      ** Normal exit conditions from handler if not handled (ST, RAM,
92      ** registers, etc.):
93      **     Carry clear
94      **     HEX mode.
95      **     XM=1.
96      **
97      ** Error exit conditions from handler:
98      **     Carry set.
99      **     Hex mode.
100     **     Error can only happen when there is not enough memory to
101     **     do the poll at all.
102     **
103     ** Available subroutine levels: 4
104     **
105     ** What registers/RAM may be used if handled?:
106     **     A-C, D1, P

838 *
839 ■
840 *****
841 *****
842 **
843 ** Name:(S) pRDCBF - Read Current Sector From Mass Memory
844 **
845 ** Category: POLL
846 **
847 ** Type: FPOLL
848 **
849 ** Purpose:
850 ** Using the FIB, read the current sector of a file in
851 ** the mass memory device into the I/O buffer that is
852 ** associated with the file.
853 **
854 ** There are total of 3 polls can be used to read/write a
855 ** sector between a mass memory device and I/O buffer:
856 ** 1. pRDNBF - Write buffer out to current sector and read
857 ** in next sector. If buffer content has not been
858 ** altered, just read in next sector.
859 ** 2. pRDCBF - Read in current sector from mass memory device
860 ** to the I/O buffer. This poll does not care
861 ** about the content currently in the I/O buffer.
862 ** 3. pWRCBF - Write I/O buffer to current sector in the mass
863 ** memory device.
864 **
865 **
866 ** Should poll be "Handled" (return with XM=0)? :Yes
867 **
868 ** Meaning of "Handling" Poll (what does code do if handled?):
869 ** Read the current sector from the mass memory device into
870 ** the I/O buffer of the file.
871 **
872 ** Entry conditions for handler (registers, ST, RAM, etc.):
873 ** B[A] = Poll number.
874 ** HEX mode.
875 ** P=0.
876 ** STMTD1 contains the FIB entry address of the file
877 ** (SNAPBF contains A, D, D0 and D1 to restore on exit)
878 **
879 ** Normal exit conditions from handler if handled (ST, RAM,
880 ** registers, etc.):
881 ** Carry clear
882 ** HEX mode.
883 ** XM=0.
884 ** File access nib in FIB is set to zero.
885 ** A,D,D0,D1 restored to values from SNAPBF.
886 **
887 ** This poll handler must always call the routine SNAPRS to
888 ** restore A,D,D0,D1 from the snap save RAM before return.
889 ** So if the polling routine calls the SNAPSV before
890 ** issuing this poll, it can consider A,D,D0,D1 will not

```

```

891      **      be changed by this poll handler.
892      **
893      ** Normal exit conditions from handler if not handled (ST, RAM,
894      ** registers, etc.):
895      **      HEX mode.
896      **      XM=1.
897      **
898      ** Error exit conditions from handler (POLL only):
899      **      Won't return to calling routine if error occur, direct
900      **      exit to BSERR routine.
901      **
902      ** Available subroutine levels:
903      **      3
904      **
905      ** What registers/RAM may be used if handled?:
906      **      A-D, DO, D1, P, ST[0-4]
907      **      (B,C,P,ST[0-4] if SNAPSV was called)
908      **
909      ** What registers/RAM may be used if not handled?:
910      **      B, C, DO
911      **      (SNAPRS is not called)
912      **
913      ** History:

920      ****
921      *
922      ****
923      ****
924      **
925      ** Name:(S) pWRCBF - Write I/O Buffer to Mass Memory Device
926      **
927      ** Category:  POLL
928      **
929      ** Type:      FPOLL
930      **
931      ** Purpose:
932      **      Using the FIB, write the file I/O buffer to
933      **      the sector it came from in a mass memory device. Buffer
934      **      content, current position and record address are not
935      **      changed by this operation.
936      **
937      **      There are total of 3 polls can be used to read/write a
938      **      sector between a mass memory device and I/O buffer:
939      **      1. pRDNBF - Write buffer out to current sector and read
940      **                  in next sector. If buffer content has not been
941      **                  altered, just read in next sector.
942      **      2. pRDCBF - Read in current sector from mass memory device
943      **                  to the I/O buffer. This poll does not care
944      **                  about the content currently in the I/O buffer.
945      **      3. pWRCBF - Write I/O buffer to current sector in the mass
  
```

```

946      **          memory device.
947      **
948      **
949      ** Should poll be "Handled" (return with XM=0)? : Yes
950      **
951      ** Meaning of "Handling" Poll (what does code do if handled?):
952      **   Write the file I/O buffer to the sector it came from in a
953      **   mass memory device.
954      **
955      ** Entry conditions for handler (registers, ST, RAM, etc.):
956      **   B[A] = Poll number.
957      **   HEX mode.
958      **   P=0.
959      **   STMTD1 contains the FIB entry address of the file
960      **   (SNAPBF contains A,D1,D0 and D1 to restore on exit)
961      **
962      ** Normal exit conditions from handler if handled (ST, RAM,
963      ** registers, etc.):
964      **   Carry clear (POLL only).
965      **   HEX mode.
966      **   XM=0.
967      **   File access nib in FIB is set to zero.
968      **   A,D,D0,D1 restored to value from SANPBF.
969      **
970      ** This poll handler must always call the routine SNAPRS to
971      ** restore A,D,D0,D1 from the snap save RAM before return.
972      ** So if the polling routine calls the SNAPSV before
973      ** issuing this poll, it can consider A,D,D0,D1 will not
974      ** be changed by this poll handler.
975      **
976      ** Normal exit conditions from handler if not handled (ST, RAM,
977      ** registers, etc.):
978      **   HEX mode.
979      **   XM=1.
980      **
981      ** Error exit conditions from handler
982      **   Won't return to calling routine if error occurs, direct
983      **   exit to BSERR routine.
984      **
985      ** Available subroutine levels:
986      **   3
987      **
988      ** What registers/RAM may be used if handled?:
989      **   A-D, D0, D1, P, ST[0-4]
990      **   (B,C,P,ST[0-4] if SNAPSV been called)
991      **
992      ** What registers/RAM may be used if not handled?:
993      **   B, C, D0
994      **   (SNAPRS is not called)
995      **
996      ** History:
997      **
998      **      Date      Programmer      Modification

13     RDSYMB SBXRAM::MS
14     *****
15     *****
16     **
17     ** Name:(S) POLL - Poll LEX Files with Process Number
18     ** Name:(S) POLLD+ - Poll LEX Files adjusting AVMEME in D(A)
19     **
20     ** Category: POLL
21     **
22     ** Purpose:
23     ** Poll All LEX Files for Special Processing
24     ** Pass # Process #, and Parameters to each LEX File
25     **
26     ** POLLD+ entry used for routines needing to pass AVMEME
27     ** in register D(A). This value is adjusted to
28     ** reflect the save area used by POLL.
29     ** Currently used by Parse and Decompile.
30     **
31     ** Entry:
32     ** POLLD+: Sets D(A) to what AVMEME will be during poll,
33     ** then falls through to POLL
34     ** Used during Parse and Decompile
35     **
36     ** Example:
37     **
38     ** GOSBVL =AVS=DO Set AVMEMS @ DO
39     ** GOSBVL =POLL Issue Poll
40     ** CON(2) =pDEVCP Device Parse Poll
41     ** GOSBVL =D=AVME Reset D(A) @ AVMEME
42     ** GOC ErrRtn Error Return
43     ** ?XM=0
44     ** GOYES Handle Handled by LEX File
45     ** ... Not handled
46     **
47     ** POLL: Process# @ Calling Routine Return Address
48     ** Process# = CON(2)
49     ** HEX Mode
50     **
51     ** Example:
52     **
53     ** GOSBVL =POLL Issue Poll
54     ** CON(2) =pFILXQ File execute poll
55     ** GOC ErrRtn Error Return

```

```

56      **      ?XM=0
57      **      GOYES Handle      Handled by LEX file
58      **      ...              Not handled
59      **
60      **      Assumes:
61      **      MTHSTK is active when called
62      **      Any routine polling with active stack must update
63      **      RVMEME to top of stack pointer
64      **      Uses SNAPBF for temporary storage of registers
65      **      Uses SAVSTK to stack POLL information
66      **      Moves memory from FORSTK --> RVMEME before Save
67      **      Memory check w/o LEEWAY for Poll Save Area
68      **      Calling routine return address saved on GOSUB stack
69      **      Will be updated if memory moves during poll
70      **
71      **      Entry to LEX File Poll Routine:
72      **      Carry Clear to indicate Normal Poll (see FPOLL)
73      **      B(A) = Process#
74      **      B(B) = Process #
75      **      B(2-4) = 0
76      **      A,D,D0,D1 = Original Contents from Calling Routine
77      **      R registers, Status are untouched by POLL
78      **      R0-R3, status cannot be destroyed while identifying
79      **      Process#.
80      **      3 levels of subroutine stack saved
81      **      One more stack level available than routine issuing
82      **      the Poll
83      **
84      **      Exit:
85      **      Carry set
86      **      Insufficient Memory to Issue Poll OR
87      **      Error return / "Something Funny" from LEX File
88      **      All registers & pointers preserved from LEX File
89      **      EXCEPT A,B
90      **      A,C have the same value on return
91      **      The contents of C on return from LEX file are
92      **      saved in A, then put back into C before return
93      **      Allows LEX Files to return Error # in C(0-3)
94      **
95      **      If not enough memory to save POLL info
96      **      C(0-3) <-- eMEM
97      **
98      **      A routine issuing POLL should check for CARRY
99      **      If there was not enough memory to issue the poll
100     **      this exception should be noted/indicated.
101     **
102     **      Carry clear
103     **      Look @ XM to determine if handled
104     **      If XM=0
105     **      Process has been handled by LEX File
106     **      All regs & ptrs preserved from LEX File
107     **      EXCEPT B,C
108     **      A is NOT destroyed
109     **
110     **      If XM=1

```

```

111      **      Process has NOT been handled
112      **      Registers & pointers restored to Entry values
113      **      EXCEPT B,C
114      **      A is not destroyed
115      **
116      **      A POLL responder must return with CARRY CLEAR
117      **      if NOT error return or NOT handled
118      **
119      **      A POLL responder must return with CARRY SET
120      **      if Error return
121      **      C(0-3) should hold the Error Number
122      **      It will be saved in A, then restored to C
123      **
124      **      Take over handler
125      **      The poll responder does not return to the POLL routine
126      **      This is allowed by certain individual polls as
127      **      indicated in their documentation headers
128      **      The handler MUST:
129      **      GOSBVL =COLLAP to collapse POLL Save info
130      **      GOSBVL =POPUPD to pop POLL issuer's rtn address
131      **
132      ** Calls:      SALLOC, CRGJMP, FIRSAV, RESRTN, RESSVA,
133      **
134      **      GLXPOL, SNAPSV, SNAPRS, MOVEU3, SNAPBF
135      **      RSTK<R, PSHSTL, MEMCKL
136      **
137      ** Uses:
138      ** Exclusive: B,C,SNAPBF,P, SAVSTK, 2 levels in RSTKBF
139      ** Inclusive: B,C,SNAPBF,P, SAVSTK, 2 levels in RSTKBF
140      **
141      ** Stk lvls:  Preserves all levels
142      **      POLL saves Calling Return Address on GOSUB
143      **      stack so it will be updated if memory moves
144      **
145      ** Detail:
146      **      B(A)      = Process#
147      **      B(B)      = Process#
148      **      B(2-4)    = 0
149      **
150      **      Save Stack:
151      **
152      **
153      **      =lAp      A      16
154      **      =lDp      D      16
155      **      =lD1p     D1     5
156      **      =lDOp     D0     5
157      **      =lPOL#p   Poll Number 5
158      **      =lRTN2p   Rtn Level 2 5
159      **      =lRTN3p   Rtn Level 3 5
160      **      =lBPDSp   Relative Position in LEX Buffer 5 SAVSTK - 5
161      **
162      **      Length of Save Stack = 62 = 3E hex
163      **
164      **      GOSUB Stack:
165      **

```

```

166      **      -----
167      **      GSBSTK -> |F| Rtn Addr 1 |          6
168      **      |-----|
169      **
170      **      Return Type = F indicate ■ Update Address
171      **
172      **      Original contents of A,D,D0,D1 sent to each LEX File
173      **      Carry clear, XM=0 on call to each LEX File
174      **      R registers and status untouched
175      **
176      **      3 levels of subroutines saved
177      **      Return Level 1 is saved on GOSUB stack as update
178      **      address incase memory moves during ■ Poll
179      **      Return Level 2 and 3 are saved in SAVSTK area
180      **      Information saved by POLL is stacked from SAVSTK
181      **      toward LOW memory.
182      **      AVMEME is adjusted above saved information.
183      **      AVMEME is readjusted when POLL returns
184      **      This allows POLL to be called "recursively"
185      **
186      **      If "Error" Response from LEX File (Carry Set)
187      **      All registers & pointers left intact EXCEPT A,B
188      **      A is used to save C during restore
189      **      A,C have the returned value of C when rtn to Caller
190      **      C(0-3) <-- Error number
191      **
192      **      If "normal" Response from LEX File (XM=0)
193      **      All registers & pointers left intact EXCEPT C,B
194      **      C has the value of A on return
195      **
196      **      If no LEX File respond (XM=1)
197      **      Restore A,D,D0,D1 to entry values
198      **      RTNSXM to Calling Routine
199      **      C is NOT set to A
200      **
201      **      If LEX File wishes Poll to continue to others
202      **      Carry must be clear, XM=1
203      **      If "non-original" contents of A,D,D0,D1 are
204      **      to be sent to other LEX Files, the information
205      **      above SAVSTK can be altered by the LEX File
206      **
207      **      Algorithm:
208      **
209      **      Save A,D,D0,D1,Rtn Lvl 1 temporary in SNAPBF (SNAPSV)
210      **      If not enough memory to save info (SALLOC)
211      **      Restore saved registers and pointers (SNAPRS)
212      **      Adjust return address past Process #
213      **      C <--- Error Number (eMEM)
214      **      RTNSC
215      **      Save Return Level 2 & 3 cus SALLOC uses 2 (D,D0)
216      **      Allocate SAVSTK area (SALLOC)
217      **      Restore Rtn Lvl 3,2 to stack
218      **      Move temporary save info to SAVSTK (MOVEU3)
219      **      Read Return Level 1, read process# @ Rtn address
220      **      Write process ■ over Return Level 1 location

```

```

221      **      Adjust Return Level 1 past Process #, saving in A(A)
222      **      Save Rtn Levels 2,3 in SAVSTK
223      **      Save 2 levels in RSTK Buffer (R<RSTK)
224      **      Push Rtn Level1 on GOSUB stack to be updated (PSHSTL)
225      **      Make sure LEEWAY is NOT checked when pushing
226      **      Restore Return Levels (RSTK<R)
227      **      Initialize Relative Offset into LEX Buffer to 0
228      ** 1:   Get LEX File POLL address (GLXPOL)
229      **      If LEX file POLL address (Carry Clear)
230      **          Save updated Rel. Position into Buffer in SAVSTK
231      **          Push LEX file jump address on stack
232      **          Restore registers,pointers,process# (RESSVA)
233      **          Pop LEX file jump address
234      **          Clear XM flag
235      **          Gosub to LEX File Poll Routine (CRGJMP)
236      **          Clear B(S) to save carry from LEX file return
237      **          If Carry set (Error response from LEX File)
238      **              Set A=C to preserve C during restore
239      **              goto 2;
240      **          If LEX File responded (XM=0)
241      **              Set B(S) = 1
242      **              goto 2;
243      **          else (No response) (XM=1)
244      **              Restore Relative Position in LEX Buffer
245      **              goto 1; (Continue polling)
246      ** 2:   Save current A,D,DO,D1 in SNAPBF and
247      **          Restore return lvls 2,3; Release SAVSTK (RESRTN)
248      **          Restore current A,D,DO,D1,Rtn Lvl 1 (SNAPRS)
249      **          Push Rtn Lvl 1 back on stack
250      **          Set C=A
251      **          Return indicating carry from LEX File (B(S))
252      **      else
253      **          (No more LEX Files in LEXBUF)
254      **          Restore A,D,DO,D1 from SAVSTK (RESSVA)
255      **          Save A->D1,Restore Rtn Lvls, Release SAVSTK (RESRTN)
256      **          Restore A->D1,Rtn1 from SNAPBF (SNAPRS)
257      **          Push Rtn Lvl 1 back on stack
258      **          RTNSXM
259      **
260      ** History:
261      **
262      **      Date      Programmer      Modification
263      **      -----
264      **      07/13/82   JP              Modified documentation
265      **      10/14/82   JP              No Leeway check when allocate Save Ar
266      **      10/14/82   JP              Rewrote to interface to SNAPBF
267      **      01/31/83   JP              After SALLOC, restore RSTK from DO
268      **      02/05/83   JP              Rewrote to save Rtn Adrrs on GSBSTK
269      **      02/05/83   JP              Set XM=1 if Carry set/Error return
270      **      02/15/83   JP              No Leeway Check when PSHSTK called
271      **      03/01/83   JP              Added IPOLra to D(A) in POLLd+ entry

32          **      TIMLST    12           time of last exact
33          **      TIMLAF    12           time of last AF correction
34          **      TIMAF     6           accuracy factor
35          **
36          ** All times are stored in units of 1/512th seconds.
37          **
38          ** -----
39          **
40          ** Software timebase correction is used to compensate for
41          ** the estimated .005% inaccuracy of the crystal timebase.
42          ** An accuracy factor (AF) specifies the accuracy of the
43          ** clock, and is defined as:
44          **
45          **      actual time = timer time(1+1/AF)
46          **
47          ** In other words, the accuracy factor tells how many
48          ** seconds should elapse before adding a second to clock
49          ** time. A positive accuracy factor will correct a slow
50          ** clock, a negative AF will correct a fast clock.
51          **
52          ** -----
53          **
54          ** The external alarm is for use by external modules
55          ** (such as pocket secretary or a controller) which may
56          ** wish to schedule events. The exact format of how each
57          ** external module maintains its alarm stack is
58          ** unimportant, as long as the following protocol is
59          ** observed:
60          **
61          ** The module may schedule an alarm if either:
62          **      1) Current external alarm is past due.
63          **      2) Current external alarm occurs after alarm
64          **         the code wishes to schedule.
65          **
66          ** When an external alarm comes due, the system will
```

```

67      ** poll and reset the external alarm pending bit.  Each
68      ** module capable of scheduling alarms should then
69      ** compare the current time to its alarm stack to
70      ** determine if any of its alarms are pending.
71      **

97      ** Stk lvs:    0
98      **
99      ** Detail:
100     **      512 hz countdown timer operates asynchronously of CPU
101     **      clock.  It can decrement at any time, including during
102     **      a read.  The double-read algorithm assures that we
103     **      do not encounter situations such as follows:
104     **      Timer = 120000, decrements after CPU reads first
105     **      three digits, yielding a reading of 11F000 (since
106     **      CPU reads LSN to MSN).
107     **
108     ** Algorithm:
109     **      Read timer -> B.
110     **      Read timer -> A.
111     **      If A#B then Read timer -> A.
112     **      B=A.
113     **      If bit 23 of B is set, then perform sign extend on A
114     **      from 6-nibble quantity to full-word and RTNSC, else
115     **      RTNCC.

585      ** Stk lvls:   1
586      **
587      ** Detail:
588      **      Here is a brief summary of the clock systems workings:
589      **
590      **      The software has available to it one 24-bit 512hz
591      **      countdown timer. For purposes of this discussion, a
592      **      "tick" is defined as 1/512 second. The range of this
593      **      timer (in 2's complement arithmetic) is from 7FFFFFFH
594      **      to -800000H ticks, or in decimal, 8388607 to -8388608.
595      **      This corresponds roughly to a range of 4.55 hours to
596      **      -4.55 hours. The timer generates a service request
597      **      whenever it goes negative (high bit set).
598      **      Since the timer obviously cannot cover even a days
599      **      worth of ticks, let alone 9999 years worth, the clock
600      **      system uses the timer as an offset relative to a time
601      **      stored in RAM. That is, it schedules a wakeup time
602      **      (called NXTIRQ), sets the timer to go negative (count
603      **      down through zero) at said time, and then can compute
604      **      the time on demand simply by computing:
605      **
606      **      TIME = NXTIRQ - (current timer value).
607      **
608      **      It is the CLKUPD routine which does the scheduling.
609      **      Calling CLKUPD says, in effect, "this is the current
610      **      time, schedule yourself to wake up." Assuming we are
611      **      not in clock mode* and no alarms have been scheduled,
612      **      the routine simply schedules a wakeup for four hours
613      **      away. When that happens, we wake up and perform
614      **      another clock update. This goes on forever.
615      **
```

```
616      **      { * Clock mode is a feature which allows lexfiles to
617      **      implement a clock without having to reschedule an
618      **      external alarm every second. It is set by setting
619      **      the f1CLOC system flag and should be cleared when
620      **      a clock mode is no longer desired. In clock mode,
621      **      the clock update interval is to the next 1-second
622      **      boundary, and the exception flag is set (to force
623      **      a poll) whenever the clock system is accessed }
624      **
625      **      If, however, any of the alarms (ALRM1-ALRM6) is set
626      **      to go off less than 4 hours away, its time is used as
627      **      the time-of-next-wakeup instead of 4 hours.
628      **
629      **      CLKUPD is executed whenever the time is computed
630      **      (execution falls through from CMPT). It is also
631      **      executed when the time (time-of-day or date) is
632      **      changed, although this occurs far less often. Rather
633      **      than simply taking "this is the current time" as input,
634      **      the routine takes "this is the current time" and "this
635      **      is what the timer read when it was computed". That
636      **      way any execution time taken after the time computation
637      **      does not manifest itself as a time error. This also
638      **      serves to reduce the time-critical code to just a few
639      **      lines at the end of the CLKUPD routine.
640      **      When CLKUPD is passed a current time and timer value,
641      **      it figures out the time-of-next-wakeup, stores that in
642      **      NXTIRQ, and sets the timer appropriately.
643      **
644      ** Algorithm:
645      **      {Time values use 12 nibbles. Sometimes nibs 12-15
646      **      are used for other things. Registers specified
647      **      without a subfield mean REG(0-11).}
648      **      Get f1CLOC flag.
649      **      C = 4 hours (expressed in ticks).
650      **      If we are not in clock mode, goto 1.
651      **      C = Time to next second:
652      **      (1 second) - [ (current time) mod (1 second) ] .
653      **      1: {C now contains update interval if no alarms}
654      **      A = current time (R1).
655      **      D = time at update (A+C).
656      **      B = current value of NXTIRQ.
657      **      1a: Prepare to build bitmap in B[15-14] {bits 0-5 of that
658      **      byte}.
659      **      For D0 = ALRM6 downto ALRM1 do
660      **      begin
661      **          Read alarm time.
662      **          If alarm time = 0 goto 3.
663      **          If alarm time > current time goto 2.
664      **          If alarm time < current value of NXTIRQ goto 3.
665      **          Mark bitmap for this alarm {alarm is pending}.
666      **          Goto 3.
667      **      2: If alarm time > time-of-next-update {D} goto 3.
668      **          D = alarm time.
669      **      3:
670      **      {D now contains the time-of-next-wakeup, which is
```

```

671      **      either the update time mentioned in "1:" above
672      **      or the earliest alarm time < 4 hours away.}
673      **      end
674      **      Move bitmap to B[B].
675      **      OR bitmap with PNDALM {new pending alarm bitmap}.
676      **      Save new bitmap in PNDALM and ST[B].
677      **      If alarms 0,1,2 or 5 are pending, set S12 {global
678      **      exception flag}.
679      **      If NXTIRQ < end-of-time then goto 4.
680      **      If current time < end-of-time then D=end-of-time;
681      **      goto 4 {schedule wakeup for end-of-time}.
682      **      current time := current time - end-of-time.
683      **      D = D - end-of-time.
684      **      B = 0.
685      **      Wrap TIMLAF and TIMLST around end-of-time.
686      **      Goto 1a.
687      **      4: {Beginning of accuracy factor correction code. If
688      **      clock is running slow, we will want to schedule the
689      **      alarm early so as not to miss it.}
690      **      D=Time until new NXTIRQ {D-A}.
691      **      If AF<0 {if clock is fast} then goto 5.
692      **      D=D*AF/(AF+1) {compute reduced time to NXTIRQ}.
693      **      {End of AF code}
694      **      5: Add D to current time {R1}, store in NXTIRQ.
695      **      {D is the new value we want to store in the timer.
696      **      To compensate for any time taken since the time
697      **      indicated in R0/R1, we will actually store the value
698      **      [D-R0+(current timer)] in the timer. Since
699      **      0 <= update amount <= 4 hours and the timer can
700      **      represent up to 4.55 hours + and -, only the
701      **      following things can screw us up:
702      **      (current timer)-R0 > .55 hours ... unlikely since
703      **      current timer should be < R0.
704      **      (current timer)-R0 < -4.55 hours ... how long did
705      **      processing take, anyway ???
706      **      If R0-(current timer) > D, an alarm came due during
707      **      processing and the timer will be negative. We'll
708      **      catch it the next time through.}
709      **      C=D, CROEX {swap new timer value with old timer value}.
710      **      D=D-C {amount to add to current timer value}.
711      **      Watch timer until kerchunk {wait for full tick window}.
712      **      Read timer; add D; write timer {and timer enable bits
713      **      to control nibble}.
714      **      Recall current time {R1}.
715      **      Return.

```

1660      ■
1661      ■ Following is the common code for the GET routines for
1662      ■ retrieving TIMLAF, TIMLST, NXTIRQ. All of these are 48-bit
1663      * unsigned quantities which can range from 0 to 92F2D17AFFFF.
1664      *
1665      ■ Because of the peculiarities of adjustment factors, it is
1666      ■ possible for TIMLAF actually to be slightly negative under
1667      ■ certain circumstances. This code performs a sign extend
1668      * only if the high nibble of the requested quantity is F.
1669      *

4203 ** Category:  TIME
4204 **
4205 ** Purpose:
4206 **   Convert from absolute day# to date.
4207 **
4208 ** Entry:
4209 **   C = Day# since day 0 (HEX).
4210 **
4211 ** Exit:
4212 **   A = Year (BCD number).
4213 **   B = Month (BCD number).
4214 **   D = Day (BCD number).
4215 **
4216 ** Calls:      HEXDEC, ESTYO, SUM3, CHKY0, IDIV, M306, ASLW4
4217 **
4218 ** Uses.....
4219 **           A,B,C,D,P
4220 **
4221 ** Stk lvs:    1
4222 **
4223 ** Algorithm:
4224 **
4225 **   Define the following conditionally depending on
4226 **   the value of MONTH:
4227 **
4228 **       If MONTH < 3 then let M = MONTH + 13
4229 **           and let Y = YEARR - 1.
4230 **       If MONTH >= 3 then let M = MONTH + 1
4231 **           and let Y = YEARR.
4232 **
4233 **   Also define the following functions:
4234 **
4235 **   SUM3(Y) = int(Y * 365.25) - int(Y / 100) + int(Y / 400)
4236 **           = -366 if Y=-1
4237 **   M306(M) = int(M * 30.6001)
4238 **

```

```

4239      ** Mapping DAY NUMBER to DATE:
4240      **
4241      **   Calculate the value of Y0 as follows:
4242      **
4243      **       Y0 = int( [(DAY# + 63) - 121.5] / 365.2425)
4244      **   This is an approximation of the correct year.
4245      **
4246      **   # Now calculate M0 as follows:
4247      **       M0 = int( [(DAY# + 63) - SUM3(Y0)] / 30.6001)
4248      **   If this M0 is less than # then the year was one too
4249      **   high; therefore let Y0 = Y0 - 1 and recalculate M0
4250      **   using the new Y0 (ie Y0 := Y0 - 1 ; GO TO #).
4251      **
4252      **   Once a value for M0 greater than or equal to 4 is
4253      **   obtained, the values of MONTH, DAY, and YEAR are
4254      **   calculated as follows:
4255      **       DAY = [(DAY# + 63) - SUM3(Y0)] - M306(M0).
4256      **       If M0 >=14 then MONTH = M0 - 13 and YEAR = Y0 + 1.
4257      **       If M0 < 14 then MONTH = M0 - 1 and YEAR = Y0.
4258      **
4259      **   360-day calendar is not done in this code. Here is how to
4260      **   do it:
4261      **
4262      **   For 360 day calendar, the number of days between two
4263      **   dates is calculated as follows:
4264      **
4265      **       Let M1 = month of first date
4266      **       Let D1 = day of month of first date
4267      **       Let Y1 = year of first date
4268      **       Let M2 = month of second date
4269      **       Let D2 = day of month of second date
4270      **       Let Y2 = year of second date
4271      **
4272      **   Now make the following adjustments:
4273      **       If D1 >= 30 then
4274      **           begin
4275      **               D1 := 30;
4276      **               if D2 = 31 then D2 := 30
4277      **           end;
4278      **   Now compute:
4279      **       Delta-days = (Y2-Y1)*360 + (M2-M1)*30 + (D2-D1)
4280      **

436      ****
437      ****
438      **
439      ** Name:(S) pRDNBF - Write Current Sector, Read Next Sector
440      **
441      ** Category:  POLL
442      **
443      ** Type:      FPOLL
444      **
445      ** Purpose:
446      **   Using the FIB, write current file I/O buffer to
447      **   where it came from in a mass memory device, and read in
448      **   next sector to the file I/O buffer.
449      **
450      **   There are total of 3 polls can be used to read/write a
451      **   sector between a mass memory device and I/O buffer:
452      **   1. pRDNBF - Writes buffer out to current sector and read
453      **               in next sector. If buffer content has not
454      **               been altered, just read in next sector.
455      **   2. pRDCBF - Reads in current sector from mass memory
456      **               device to the I/O buffer. This poll does
457      **               not care about the content currently in the
458      **               I/O buffer.
459      **   3. pWRCBF - Writes I/O buffer to current sector in the
460      **               mass memory device.
461      **
462      **
463      ** Should poll be "Handled" (return with XM=0)? :Yes
464      **
465      ** Meaning of "Handling" Poll (what does code do if handled?):
466      **   As specified above.
467      **
468      ** Entry conditions for handler (registers, ST, RAM, etc.):
469      **   B[R] = Poll number.
470      **   HEX mode.
471      **   P=0.
472      **   STMTD1 contains the FIB entry address of the file
473      **
474      ** Normal exit conditions from handler if handled (ST, RAM,
475      ** registers, etc.):

```

```

476      **      Carry clear.
477      **      HEX mode.
478      **      XM=0.
479      **      Current position in FIB is set to start of next sector.
480      **      File access nib in FIB is set to zero.
481      **
482      **      This poll handler always call the routine SNAPRS to
483      **      restore A,D,DO,D1 from the snap save RAM before return.
484      **      So if the polling routine calls the SNAPSV before issuing
485      **      this poll, it can consider A,D,DO,D1 will not be change
486      **      by this poll handler.
487      **
488      **      Normal exit conditions from handler if not handled (ST, RAM,
489      **      registers, etc.):
490      **      HEX mode.
491      **      XM=1.
492      **
493      **      Error exit conditions from handler:
494      **      Won't return to calling routine if error occur, direct
495      **      exit to BSERR routine.
496      **
497      **      Available subroutine levels: 3
498      **
499      **      What registers/RAM may be used if handled?:
500      **      A-D, DO, D1, P, ST[0-4]

1379      **
1380      ** Purpose: Read in values from file and store to variables.
1381      ** This code works for file both in RAM and in mass
1382      ** memory device in HPIL.

```

```

1383      **          Only works for file type TEXT, SDATA, DATA, will
1384      **          poll for unrecognized.
1385      **
1386      ** Entry: DO points past the READ# token
1387      **
1388      ** Exit: Exit to NXTSTM
1389      **
1390      ** Detail:
1391      **
1392      ** 1. Find the channel # and its FIB entry address, save the
1393      **    FIB entry address in STMTD1.
1394      ** 2. If record # is specified, set file pointer points to that
1395      **    record.
1396      ** 3. Call expression execution to recall the next variable in
1397      **    the list. If the variable is not exist yet, create it.
1398      ** 4. Call the routine DEST to save the destination address in
1399      **    the STMTRO & STMTRI.
1400      ** 5. If the variable is a simple variable, set the MTHSTK to
1401      **    equal to the FORSTK.
1402      ** 6. If the variable is an array variable, modify the dope
1403      **    vector and put it on top of the FORSTK and set the MTHSTK
1404      **    to point to it. The modified dope vector contains the #
1405      **    of the elements in the array and the address of the next
1406      **    element.
1407      ** 7. Read next data item from the file and update the file
1408      **    pointer.
1409      ** 8. Put the value on to the math stack and set the MTHSTK to
1410      **    point to it. Call STORE to assign the value to the
1411      **    variable or array element.
1412      ** 9. Drop the stack pointer and set the MTHSTK to pass the
1413      **    data item on the stack.
1414      ** 10. If the updated MTHSTK = FORSTK, we know we just done with
1415      **    a simple variable. Then go to see if the variable
1416      **    exhausted Yet, else continue.
1417      ** 11. If the updated MTHSTK # FORSTK, last data item was
1418      **    assigned to an array element. Decrement the element count
1419      **    in the array dope vector and update the next element
1420      **    address. If the element count drops to zero, done with
1421      **    the array, else continue to next element.
1422      **

```

```

1438      **      file is 8.
1439      **
1440      ** Should poll be "Handled" (return with XM=0)? : Yes
1441      **
1442      ** Meaning of "Handling" Poll (what does code do if handled?):
1443      **      Complete the execution of READ # statement.
1444      **
1445      ** Entry conditions for handler (registers, ST, RAM, etc.):
1446      **      B[A] = Poll number.
1447      **      HEX mode.
1448      **
1449      **      D[S] = Copy code of the file.
1450      **      D[A] = # of bytes to end of file
1451      **      RO(A) = Current position (absolute address)
1452      **      RO(15:14) = Relative position in buffer if external
1453      **      R1 = Record length in bytes
1454      **      CHN#SV = Channel # specified in the statemnt.
1455      **      STMTD1 = FIB entry address of the file.
1456      **      (All the file related information can be found in the
1457      **      FIB entry of the file)
1458      **      STMTD0 = Program counter points at the semicolon of the
1459      **      statement.
1460      **      S9 = 0 if serial access (record # not specified)
1461      **      = 1 if random access
1462      **      S10 = 0 if file is in mainframe RAM/ROM
1463      **      = 1 if file is in external mass memory device
1464      **      S11 = 0 if file is not in Independent RAM
1465      **      = 1 if file is in Independent RAM
1466      **
1467      **      At the time when this poll is issued, the READ#
1468      **      already process the channel number and the record number
1469      **      -if specified.
1470      **      If the record number has been specified, the pSREC# poll
1471      **      should been issued earlier so the file pointer (in the
1472      **      FIB) should already pointing at the start of the record.
1473      **
1474      ** Normal exit conditions from handler if handled (ST, RAM,
1475      ** registers, etc.):
1476      **      If the poll is handled, the handler should handle the
1477      **      statement completely. So the handler should directly
1478      **      exit to NXTSTM. The handler doesn't need to worry
1479      **      about the math stack used by the POLL routine, it will
1480      **      be taken cared by the run loop.
1481      **
1482      ** Normal exit conditions from handler if not handled (ST, RAM,
1483      ** registers, etc.):
1484      **      Carry clear.
1485      **      HEX mode.
1486      **      XM=1.
1487      **
1488      ** Error exit conditions from handler:
1489      **      Carry set.
1490      **      HEX mode.
1491      **      C[0-3] = Error number.
1492      **

1534      ** Entry conditions for handler (registers, ST, RAM, etc.):
1535      **      Carry set.
1536      **      B[A] = Poll number.
1537      **      HEX mode.
1538      **      P=0.
1539      **      STMTD1 contains the FIB entry address of the file.
1540      **      The file pointer in FIB is pointing at :
1541      **      TEXT file : End-of-file mark (FFFF).
1542      **      SDATA file: Past the last data item of the file.
1543      **      DATA file : Pointing at an end-of-file mark or past the
1544      **                      end of the file.
1545      **
1546      ** Normal exit conditions from handler if handled (ST, RAM,
1547      ** registers, etc.):

```

```

1548      **      If handle, the handler should never return to the polling
1549      **      routine. If it ever returns to the polling routine, an
1550      **      "End of File" will be generated.
1551      **      This poll is just provide a hook for an LEX file
1552      **      to intercept the end-of-file error. The possible thing
1553      **      an LEX file can do to answer this poll is to implement
1554      **      a "ON EOF GOTO/GOSUB <label>" type of trap.
1555      **
1556      ** Normal exit conditions from handler if not handled:
1557      **      HEX mode.
1558      **      P = 0
1559      **
1560      ** Error exit conditions from handler (POLL only):
1561      **      HEX mode.
1562      **      P = 0
1563      **
1564      ** Available subroutine levels: 6
1565      **
1566      ** What registers/RAM may be used if handled?:
1567      **      All CPU registers, scratch RAM, ST11-0.
1568      **
1569      ** What registers/RAM may be used if not handled?:

2006 *****
2007 *****
2008 ** Name:   PRINT# - PRINT# Statement Execute
2009 **
2010 ** Category: STEXEC
2011 **
2012 ** Purpose: Write data to data file.
2013 **           The code here works for file both in RAM or mass
2014 **           memory device. But will only work with type TEXT,
2015 **           SDATA and DATA files. It will poll for unrecognized
2016 **           file type.
2017 **
2018 ** Entry: DO points past the PRINT# token
2019 **
2020 ** Exit: Exit to NXTSTM
2021 **
2022 ** Detail:
2023 ** . PRINT# only works with an opened file. When a file is
2024 **   opened, an entry in FIB is created. The FIB keep track all
2025 **   information relate to that file, such as file type, file
2026 **   is a memory resident file or external file, current file
2027 **   pointer.

```

```

2028      **
2029      ** . If the file is in an external device, there should be an
2030      ** I/O buffer containing the current sector of the file. The
2031      ** PRINT# writes data direct to the I/O buffer. When the last
2032      ** byte of the buffer is filled, the PRINT# will poll the
2033      ** HPIL ROM to write the I/O buffer back to the file and read
2034      ** the next sector into the I/O buffer.
2035      **
2036      ** . If the file copy code is 8, the PRINT# will issue a poll
2037      ** to see if there is any LEX file want to handle it. The LEX
2038      ** file is supposed to take over the PRINT# statement from
2039      ** there.
2040      ** But the PRINT# execution will do the following things
2041      ** before pulling for copy code 8 file :
2042      ** 1. Get the channel number and find the FIB entry address
2043      ** of the file. The FIB entry address is stored in STMTD1.
2044      ** 2. Get the record number, if specified, and set the file
2045      ** pointer to the start of the specified record. Since the
2046      ** mainframe code doesn't know how to search a record in
2047      ** the copy code 8 file, a poll (pSRECH) will be issued
2048      ** for that purpose.
2049      ****
2050      ****
2051      ■
2052      ****
2053      ****
2054      **
2055      ** Name:(S) pPRINT# - PRINT# on File of Copycode = 8
2056      **
2057      ** Category: POLL
2058      **
2059      ** Type: POLL
2060      **
2061      **
2062      ** Purpose:
2063      ** Execution of PRINT # statement when the copy code of the
2064      ** file is 8.
2065      **
2066      ** Should poll be "Handled" (return with XM=0)? : Yes
2067      **
2068      ** Meaning of "Handling" Poll (what does code do if handled?):
2069      ** Complete the execution of PRINT # statement.
2070      **
2071      ** Entry conditions for handler (registers, ST, RAM, etc.):
2072      ** B[A] = Poll number.
2073      ** HEX mode.
2074      ** P=0.
2075      **
2076      ** D[S] = Copy code of the file.
2077      ** D(A) = ■ of bytes to end of file
2078      ** RO(A)= Current position (absolute address)
2079      ** RO(15:14) = Relative position in buffer if external
2080      ** R1 = Record length in bytes
2081      ** CHN#SV = Channel # specified in the statemnt.
2082      ** STMTD1 = FIB entry address of the file.

```

```

2083      **      (All the file related information can be found in the
2084      **      FIB entry of the file)
2085      **      STMTDO = Program counter points at the semicolon of the
2086      **      statement.
2087      **      S9 = 0 if serial access (record # not specified)
2088      **      = 1 If random access
2089      **      S10 = 0 if file is in mainframe RAM/ROM
2090      **      = 1 if file is in external mass memory device
2091      **      S11 = 0 if file is not in Independent RAM
2092      **      = 1 if file is in Independent RAM
2093      **
2094      **      At the time when this poll is issued, the READ#
2095      **      already process the channel number and the record number
2096      **      -if specified.
2097      **      If the record number has been specified, the pSRECH poll
2098      **      should been issued earlier so the file pointer(in the
2099      **      FIB) should already pointing at the start of the record.
2100      **
2101      **
2102      ** Normal exit conditions from handler if handled (ST, RAM,
2103      ** registers, etc.):
2104      **      If handled, the handler should complete the PRINT#
2105      **      statement and directly exit to NXTSTM. The math stack
2106      **      will be cleared by the run loop automatically.
2107      **
2108      ** Normal exit conditions from handler if not handled (ST, RAM,
2109      ** registers, etc.):
2110      **      Carry clear.
2111      **      HEX mode.
2112      **      XM=1.

2717 **
2718 ** Name:(S) STKVCT - Process Array Dope Vector
2719 **
2720 ** Category:  EXCUTL
2721 **
2722 ** Purpose: Process an array dope vector on math stack. When
2723 ** printing or reading an array to or from a data file,
2724 ** it is done one element at a time. The array dope vector
2725 ** will remain on the stack until done, so it can be used
2726 ** to keep track of the next element addr and number of
2727 ** elements left to be done.
2728 ** The dope vector on the math stack will contain :
2729 ** Nibs      Meaning
2730 ** -----
2731 ** 0         Variable type. A-Int, B-Short, C-Real....
2732 ** 1         Dimensions. (1 or 2)
2733 ** 2         Option base.
2734 ** 3-6      Maximum string length if is string variable
2735 ** 7-10     Number of elements left to be done.
2736 ** 11-15    Next element address.
2737 **
2738 ** Entry:   D1 @ stack pointer
2739 **          If S8 =1, rewrite dope vector
2740 ** EXIT:
2741 **          Following status bit will be set properly :
2742 **          Notnum(S0) - Not simple real
2743 **          Array (S1) - Numeric or String array
2744 **          String(S2) - String or string vector
2745 **          Cmplex(S3) - Complex number or Complex array
2746 **          If is an array element(S1=1):
2747 **          Carry clear => All elements done
2748 **

3250 ** Name:    GETSPC - Make Space in File for Write
3251 **
3252 ** Category: FILUTL
3253 **
3254 ** Purpose: Find out if there is enough room left in the
3255 **           current file for a write. If there is not enough
3256 **           room left, try to expand the file.
3257 **
3258 ** Entry:   D(A) = # of bytes left in current file
3259 **           C(A) = # of bytes required
3260 **           STMTD1 = Entry address in FIB
3261 **           If the file need to be expanded, S4 will be used to
3262 **           determine where the routine should return to after
3263 **           the file has been expanded:
3264 **           S4 = 1 - Return to calling routine.
3265 **           = 0 - Exit to the main loop of PRINT# code
3266 **               (PRT220).
3267 **
3268 ** Exit:    Carry clear => There is enough room left in the file
3269 **           Carry set => Not enough room to expand the file
3270 **           If file has been expanded and S4=0, exit to PRT220
3271 **
3272 **           If the current file doesn't have enough room to store
3273 **           the string, but the file is in RAM, this routine will
3274 **           try to expand the file.
3275 **           If the expansion is successful, the S4 will be used
3276 **           to determine where this routine should return to.
3277 **           If the S4 = 0, this routine will exit to PRT220
3278 **           directly.
3279 **           The reason for not returning to calling routine is that
3280 **           after expanding file, most of the information kept in the
3281 **           CPU registers are lost, such as data type, file pointer,
3282 **           record size, etc. So directly exit to PRT220 will cause
3283 **           the whole process of printing next data item to the file
3284 **           starting over again.
3285 **
3286 ** Uses:    Nothing, if still room left
3287 **           A,B,C,D,DO,D1,R0,R1,R3,S2 If need to expand the file

3463 **
3464 ** Name:(S) STRHED - Generate String Head on Stack
3465 **
3466 ** Category:   EXCUTL
3467 **
3468 ** Purpose: Generates string header on stack
3469 **
3470 ** Entry:
3471 **   The string data is sitting on top of MTHSTK
3472 **   D1 @ top of the string
3473 **   (MTHSTK) @ end of the string (beyond last character)
3474 **
3475 ** Exit: String header will be written on top of the string.
3476 **   D1 @ string header.
3477 **   (MTHSTK) @ string header.
3478 **   If not enough memory to generate the header(16 nibs),
3479 **   it will direct exit to MFERR error routine.
3480 **
3481 ** Calls: STK16?
3482 **
3483 ** Uses: A,B,C(A),DO,D1
3484 **
3485 ** Stk lvls: +1
3486 **

74      ** Exit:
75      **      P=0
76      **      If carry set then A(A)=Function code.
77      **      If carry clear then CHEDIT was terminated by an
78      **      immediate execute key. R3(A)=Definition length.
79      **      D1 points to first char of definition.
80      **
81      **
82      ** Calls:      CHEDEX, CHROUT, DSPCHA, DSPCHR, DSPCL?, DSPSPC,
83      **      KEYRD, TBLJMC, WRIT05, WRITE, bf2dsp.
84      **
85      ** Uses:
86      **      A,B,C,D,P,DO,D1,R0,R3,ST,DEFADR,USRSTA,32 nibs at
87      **      SCRICH.
88      **
89      ** Stk lvls:   6
90      **
91      ** Detail:
92      **      This subroutine implements a character editor which
93      **      accepts keyboard input and edits display as needed
94      **      until a key is entered which is not meaningful in
95      **      character edit mode. The keycode of the terminator
96      **      is returned in the R register. The following keys
97      **      are terminators:
98      **
99      **      A(A)  Key#  Function
100     **      13 -- 38 -- EndLine
101     **      14 -- 43 -- Attention
102     **      15 -- 46 -- RUN key
103     **      16 --112 -- CONTInue key
104     **      17 --102 -- SST key
105     **      18 -- 50 -- Cursor up
106     **      19 -- 51 -- Cursor down
107     **      20 --162 -- Cursor to top
108     **      21 --163 -- Cursor to bottom
109     **      22 --155 -- g Attention
110     **      23 --111 -- CALC mode key
111     **      24 -- 99 -- OFF key
112     **      25 --164 -- g EndLine (Cmd Stack)
113     **
114     **      Although these keycodes map to the same values as
115     **      certain control keys (ctrl-M through ctrl-Y), hitting
116     **      the CTRL sequence followed by a key will NOT be
117     **      interpreted as one of these terminators with the
118     **      exception of CTRL-M. They will simply be put into the
119     **      display as funny-looking characters.
120     **

588			*****		
589			**		
590			**	Name:(S) pWTKY	- Poll When Waiting For Key
591			**		
592			**	Category:	POLL
593			**		
594			**	Type:	FPOLL
595			**		
596			**	Purpose:	

```
597      **      Allow LEXFILE to circumvent waiting for and fetching
598      **      ket# in KEYRD.
599      **
600      **      Should poll be "Handled" (return with XM=0)?:
601      **      Yes, if LEXFILE wishes to "press" a key.
602      **
603      **      Meaning of "Handling" Poll (what does code do if handled?):
604      **      Lexfile is "press"ing a key. If poll is handled,
605      **      KEYRD goes on to process key returned by this poll.
606      **
607      **      If poll is not handled, KEYRD will look for repeating
608      **      keys. Seeing none, KEYRD will pop the next key# from
609      **      the keybuffer or, if buffer is empty, wait until a key
610      **      is hit and then process it.
611      **
612      **      Entry conditions for handler (registers, ST, RAM, etc.):
613      **      Carry set.
614      **      B[A] = Poll number.
615      **      HEX mode.
616      **      P=0.

619      **      registers, etc.):
620      **      HEX mode.
621      **      XM=0.
622      **      RO[B] contains key# (physical keycode).
623      **
624      **      Normal exit conditions from handler if not handled (ST, RAM,
625      **      registers, etc.):
626      **      HEX mode.
627      **      XM=1.
628      **
629      **      Available subroutine levels:
630      **      2
631      **
632      **      NOTE:
633      **      We are just entering KEYRD when this poll occurs.
634      **
635      **      This is the time to press a key. The time to provide
636      **      a definition for a pressed key is the pKYDF poll.
637      **
638      **      What registers/RAM may be used if handled?:
639      **      A-D, DO, D1, P, RO, R3.
640      **      SCRTCH RAM.
641      **
642      **      What registers/RAM may be used if not handled?:
643      **      A-C, D[15-5] DO, D1, P, RO, R3.
644      **      SCRTCH RAM.
645      **
646      **      Special memory/pointer considerations (are pointers funny?):
647      **      May be in CALC mode.
648      **
649      **      Envisioned application(s):
650      **      External keyboard controller or remote keyboard.
651      **      The poll handler may take over waiting for a key to
```

```

652      **          go down if appropriate.
653      **

657      **      -----      -
658      **      05/19/83   NM           Added documentation
659      **
660      ** *****
661      ** *****
662      ** *****
663      ** *****
664      **
665      ** Name:(S) pKYDF   - Poll To Define Key
666      **
667      ** Category:   POLL
668      **
669      ** Type:       FPOLL
670      **
671      ** Purpose:
672      **      Allow LEXFILE to define action/definition of a key.
673      **
674      ** Should poll be "Handled" (return with XM=0)?:
675      **      Yes, if you want to define or act on the key.
676      **
677      ** Meaning of "Handling" Poll (what does code do if handled?):
678      **      LEXFILE is either defining or otherwise acting on key.
679      **      Defining (returning with S0=1) means that the LEXFILE
680      **      is returning a definition to whomever called KEYRD
681      **      (CHEDIT, CALC mode editor, or whoever).
682      **      Acting on (returning with S0=0) means that the LEXFILE
683      **      is using the key in some way (such as toggling a
684      **      flag or ignoring) and KEYRD should not return a
685      **      definition to the caller, but should instead get the
686      **      next key to process.
687      **
688      ** Entry conditions for handler (registers, ST, RAM, etc.):
689      **      Carry set.
690      **      B[A] = Poll number.
691      **      HEX mode.
692      **      P=0.
693      **      RO[A]=keycode (from keycode map),
694      **      RO[9-5]=key# (physical keycode).
695      **
696      ** Normal exit conditions from handler if handled (ST, RAM,
697      ** registers, etc.):
698      **      HEX mode.
699      **      XM=0.
700      **      If handled but not returning a definition ("acting on"
701      **      a key): S0=0.
702      **      If returning a definition:
703      **      S0=1.
704      **      Definition pointer in DEFADR (in RAM) as follows:
705      **      DEFADR: Length of string in bytes (2 nibs).
706      **      DEFADR+2: Key type (1 nib).

```

```

707      **      0 = Single ASCII character. Includes
708      **      control chars 0-31, which may cause
709      **      some action by caller.
710      **      1 = ASCII control char + #40. This is
711      **      a character in the range 0-31 which
712      **      is to be interpreted strictly as a
713      **      character, not as special action keys
714      **      (cursor-right, etc.). To return
715      **      char #01, DEFADR should point at #41
716      **      byte, etc.
717      **      2 = User defined key--terminating.
718      **      4 = User defined key--non-terminating.
719      **      6 = User defined key--immed execute.
720      **      8-F = LEX table entry, with lower 3 bits
721      **      as follows:
722      **      0: Parentheses needed.
723      **      1: Trailing space needed.
724      **      2: Leading space needed.
725      **      DEFADR+3: Address of text.
726      **
727      ** Normal exit conditions from handler if not handled (ST, RAM,
728      ** registers, etc.):
729      **      HEX mode.
730      **      XM=1.
731      **
732      ** Available subroutine levels:
733      **      2
734      **
735      ** What registers/RAM may be used if handled?:
736      **      A-D, D0, D1, P, R0, R3.
737      **      SCRATCH RAM.
738      **
739      ** What registers/RAM may be used if not handled?:
740      **      A-C, D[15-5] D0, D1, P, R3.
741      **      SCRATCH RAM.
742      **
743      ** Special memory/pointer considerations (are pointers funny?):
744      **      May be in CALC mode.
745      **
746      ** Envisioned application(s):
747      **      Redefine keyboard.
748      **
749      **      One interesting application: Stuff funny key# in
750      **      keybuffer (perhaps at pSREQ) and define it here.

**
** Name:(S) NRMCON - Convert BLDCON Constant into Usable Form
**
** Category:  MTHUTL
**
** Purpose:
**   Converts a 12-digit constant built by BLDCON into a
**   nice normalized number taking into account overflow and
**   underflow with appropriate trap settings.
**
** Entry:
**   Exit conditions of BLDCON.
**
** Exit:
**   A      = 12-digit normalized number.
**   XM=0 iff number ok (no overflow or underflow)
**   May generate warning message if XM=1.
**
** Calls:    SFLAGS, MFWRNQ
**
** Uses.....
**   A-D,DO,D1,R0,P
**
** Stk lvls: 3
**
** History:
**
**   Date      Programmer      Modification
**   -----
1854          SA              Wrote

169 TRSFnu STITLE Transform Utility Routine
170 *****
171 *****
172 **
173 ** Name: (S) TRSFnu - Transform Utility Routine
174 **
175 ** Category: EXCUTL
176 **
177 ** Purpose:
178 ** Transform a file using source/dest file info on Save
179 ** Stack.
180 **
181 ** Entry:
182 ** P = 0
183 ** /DFTYP = Destination file type
184 ** Save stack info set up by SVINFO by COPYX or TRSFMX
185 **
186 ** Exit:
187 ** P = 0
188 ** C(1-0) = Transformation option
189 ** C(6-2) = Dest file creation first parameter
190 ** C(11-7) = Dest file creation second parameter
191 ** Save Stack info cleared from Save Stack
192 ** Carry clear:
193 ** Transform completed successfully
194 ** Carry set:
195 ** C(3-0) = Error code. "Syntax" if all errors were
196 ** recoverable.
197 **
198 ** Calls: FILFIL, EXPDEV, RDINFO/S, SVINFO, OPENF*, FINDFS, CRTF,
199 ** RAM/OM, MEMCHE, POLL, PRGFI#, LOCFI+, RPLLIN,
200 ** WRITNB, and a host of local utilities
201 **
202 ** Uses:.....
203 ** Inclusive: All CPU registers, statement and function scratch,
204 ** TRFMBF, S11-S0
205 **
206 ** Stk lvls: 6 (RSTKBF: 1 plus any used by handlers)
207 **
208 ** Detail:
209 ** -----
210 **
211 ** Status Used:
212 ** -----
213 **
214 ** Val Phase Name Meaning
215 ** -----
216 ** (0) ( 1 ) sEXTDV Source or destination is on HPIL device.
217 **
218 ** (0) ( 2 ) sTFREQ If set, a transform is required. Other-
219 ** wise it is a trivial case (file is already
220 ** desired type).
221 **
222 ** (1) ( 1 ) sUNDEF Indicates both file names are undefined.
223 **

```

```

279      **      Set "Transform IN PLACE"
280      **      Store source FIB# as dest FIB#
281      **      If file is secure, then
282      **      Error exit
283      **      If dest device is HPIL then
284      **      If "Transform IN PLACE" then
285      **      Error exit
286      **      Else
287      **      If dest device is not RAM
288      **      Error exit
289      **      Find transform handler
290      **      If no handler, then
291      **      If transform required, then

1333      **
1334      ** Type:          FPOLL
1335      **
1336      **
1337      ** Purpose:
1338      **     Ask for an address to call for line-by-line transforma-
1339      **     tion, and a similar address to call for line-by-line
1340      **     inverse transformation should that become necessary.
1341      **     The interface for these routines is defined in the
1342      **     Detail below.
1343      **
1344      ** Should poll be "Handled" (return with XM=0)?:
1345      **     Yes.
1346      **
1347      ** Meaning of "Handling" Poll (what does code do if handled?):
1348      **     The required information is present in the registers.
1349      **
1350      ** Entry conditions for handler (registers, ST, RAM, etc.):
1351      **     R0(A) = Source file type
1352      **     R1(A) = Destination file type
1353      **     S0      = Set if dest type  $\neq$  source type, means
1354      **               that a transform IS required (sTFREQ)
1355      **     S5      = Set if transform is in place (sTFINP)
1356      **     /OPTN   = TRANSFORM option set by extended TRANSFORM
1357      **               parse (or zero if mainframe parse), as in:
1358      **               TRANSFORM F INTO DATA FF,R
1359      **               where R means random I/O records (no overlap)
1360      **               See detail below for address of /OPTN
1361      **     /PARM1,
1362      **     /PARM2 = TRANSFORM destination file create parameters
1363      **               set by extended TRANSFORM parse (or zero if
1364      **               mainframe parse), as in:
1365      **               TRANSFORM F INTO DATA FF,R,50,128
1366      **               where /PARM1 = 50 = number of records,
1367      **               /PARM2 = 128 = record size
1368      **               See detail below for addresses of /PARM1 and
1369      **               /PARM2
1370      **     P       = 0
1371      **     Carry   = Set on entry
1372      **     B[A]    = Poll number
1373      **     HEX mode
1374      **
1375      ** Normal exit conditions from handler if handled (ST, RAM,
1376      ** registers, etc.):
1377      **     R0(A) = Address of handler routine which can read
1378      **             one line in from source and transform it.
1379      **             See Detail below for handler interface.
1380      **     ** 5 nibbles before this address is stored the
1381      **             relative address of handler routine which can
1382      **             read one line in from source and transform it
1383      **             in the INVERSE direction; 0 if none exists.
1384      **             Interface is same as that of a normal handler
1385      **             routine. See Detail for handler interface.
1386      **     ** 10 nibbles before this address is stored
1387      **             the relative address of a routine which will

```

```

1388      **      finish the fully transformed destination file
1389      **      before it is closed (e.g., to chain a BASIC
1390      **      file in RAM before leaving it); 0 if no such
1391      **      routine is needed. See Detail below for the
1392      **      finish-up routine interface.
1393      **      RO(S) = Copy code of destination file type
1394      **      S5     = Entry condition (sTFINP)
1395      **      S0     = 1 if transform handler routines must be called
1396      **                to perform transformation (even though source
1397      **                and dest file types may be the same)
1398      **                = 0 if no transform handler routines need to be
1399      **                called (source file and dest file type must
1400      **                be the same)

1485      ****
1486      **
1487      **      INTERFACE TO TRANSFORM HANDLER FINISH-UP ROUTINE
1488      **
1489      ** Purpose:
1490      **      To finish up the destination BASIC file after all TEXT
1491      **      lines have been transformed into BASIC. There are
1492      **      several cases to be dealt with:
1493      **
1494      **      End of a Dry Run (always out-of-place transform):
1495      **      If the destination file is on an external medium, a
1496      **      first pass or "dry run" is conducted without creating
1497      **      the dest file, in order to determine its necessary data

```

```

1498      **      size. This routine calculates the needed parameters
1499      **      to create the file (see CRTF utility), and stores them
1500      **      in /PARM1 and /PARM2.
1501      **
1502      **      End of a Normal Run, Out-of-Place Transform:
1503      **      If the destination file type requires a subheader or
1504      **      Implementation field, it must be properly initialized
1505      **      since CRTF stored a default value in it when the file
1506      **      was created (see CRTF utility). For example, if the
1507      **      destination is a BASIC file, hex value 00000000000F
1508      **      must be written to the header to indicate that the link
1509      **      chain heads have not been computed for this file (file
1510      **      has not been "chained"). If the file is in memory, the
1511      **      the proper link chain heads are computed and written to
1512      **      the subheader. File data, such as links between sub-
1513      **      programs in BASIC files, may need to be updated.
1514      **
1515      **      End of a Normal Run, In-Place Transform:
1516      **      If the source file type had a subheader or Implementa-
1517      **      tion field, it must be removed. If the destination
1518      **      file type requires a subheader or Implementation field,
1519      **      it must be inserted after the file header and set to
1520      **      the proper value. File data, such as links between
1521      **      subprograms in BASIC files, may need to be updated.
1522      **
1523      **      End of an Inverse Transformation (Always In-Place):
1524      **      If the source file type had a subheader or Implementa-
1525      **      tion field, it it is still there but may need to be
1526      **      updated to reflect the new state. File data, such as
1527      **      links between subprograms in BASIC files, may need
1528      **      to be updated.
1529      **
1530      **      Entry:
1531      **      Output buffer collapsed (OUTBS, AVMEMS point to SYSEN)
1532      **      R4(15-14) = FIB# of destination file. Each line of the
1533      **      source file (including EOF) has been read,
1534      **      transformed, and written to the dest file.
1535      **      The End of Data field in the FIB is set to
1536      **      this new end of file and, if the dest file
1537      **      is in memory, any excess nibs beyond the
1538      **      end of file have been removed from the
1539      **      file chain. File is now rewound.
